V/COUSTIC

INNOVATIVE ACOUSTIC SOLUTIONS

WHY ACOUSTICAL TREATMENT ?

- Improve Overall Sonic Balance
- Improve Stereo Imaging & Depth
- Improve Detail & Focus
- Decrease Listening Fatigue
- Decrease Reverberations & Flutter Echo
- Improve Dialogue Intelligibility
- Rise Above The Competition
- Improved Client Satisfaction

**REVERBERATION, RESONANCES & NOISE,
AS WELL AS MATERIALS LIKE
GLASS, BRICK & CONCRETE
CAN DESTROY
A MUSICAL EXPERIENCE,
INTELLIGIBILITY & COMFORT.**

V//COUSTIC

INNOVATIVE ACOUSTIC SOLUTIONS

SOLUTIONS FOR EVERY SITUATION

- 2-Channel Listening Rooms
- Home Theatres
- Living Areas
- Recording Studios
- Offices & Greeting Areas
- Boardrooms
- Restaurants & Bars
- Public Spaces
- Schools
- Houses Of Worship
- Stadiums

WHY VICOUSTIC ?

- Hand Made In Portugal
- In-House Anechoic Testing Chamber
(Variable Dimensions)
- Vast Selection Of Panels & Color Patterns
- Cover All Areas Of Acoustical Treatment
(Absorption / Diffusion / Bass Traps)
- Custom Acoustical Analysis Available
(Upon Request)
- In-House Project Support At Focal-Naim
- Custom Colors & Patterns Available
(No Extra Charge For Certain Models)
- Acoustical Graph Available For All Models
- Made Exclusively With Recycled Materials

V//COUSTIC

INNOVATIVE ACOUSTIC SOLUTIONS

PRIMARY REFLECTIONS CONTROL

- When a hi-fi system is playing, the listener hears a combination of direct sound coming straight from the speakers and multiple sound reflections coming from the room's surfaces.
- Some of these reflections arrive at the listening position very soon after the direct sound, and we call these first reflections.
- First Lateral Reflections may influence the stereo image (by shifting or broadening it) and the perception of spaciousness within the Hi-Fi room.

SOUND FIELD ANOMALIES CONTROL

- Mainly two sound field anomalies that are likely to occur
- **Flutter Echoes** are repeated sound reflections caused by sound traveling between parallel reflective surfaces, such as walls, floor and ceiling.
- Use sound absorbing products and sound diffusers.
- By treating first reflections and reverberation one is already dealing with flutter echoes.
- **Room modes** occur in rooms due to the relationship between low frequency wavelengths and room dimensions. Small rooms such as Hi-Fi rooms normally have poor acoustic response at low frequencies due to these modes.
- Bass Trap solutions in the corners of the rooms, where high sound pressure levels occur, will enhance definition and clarity.

REVERBERATION TIME OPTIMIZATION (RT)

- Reverberation is the persistence of sound within an enclosed space as a result of repeated reflections or scattering from the room's surfaces or objects.
- The more persistent the sound is, the higher the reverberation will be and vice versa.
- The degree of reverberation may influence spaciousness and signal perception/ definition and the Reverberation Time (RT) is the acoustic parameter that quantifies it.
- In rooms with high RT's, where late reflections take a long time to be extinguished, the direct sound may be blurred, therefore compromising signal perception.
- In rooms with low RT's may end up sounding too acoustically "dry" or "dead", compromising the enjoyment of being enveloped by music.
