METHANDIENONE Tablet (10 mg) Dianabol is another name for the oral steroid methandrostenolone or Methandienone. It is a derivative of testosterone, exhibiting strong anabolic, and moderately androgenic properties. Danabol is taken before meals. The starting dosage for an adult is 10-15 mg per day. Sometimes it is increased to 30 mg per day. The dosage to maintain the achieved effect is 5-10 mg per day. #orange #orangeflowerwater #distillery #making #process #instagram #instalike #instapic #ilmazahar #xaghra #local #traditional #fire #blossom #essentialoils #aromatherapy #healing #reduceinflammation #filming #photography #lovemyjob #therapy #water #medicine #gozo #malta #artisan #bitterorange #vapour #heating

Steam inhalation

### Don'ts

Do not whisper

Do not self-medicate

Avoid caffeine

Dianabol reaches the blood after 1-3 hours. A simple application of only 10 mg results in a 5-fold increase in the average testosterone concentration in the male. Women should not use Dianabol because, due to its distinct androgenic component, considerable virilization symptoms can occur. Danabol / Dianabol causes a considerable strain on the liver and high dosages or use of over a longer period of time, is liver-toxic. Even a dosage of only 10 mg.per day can increase the liver values but after discontinuation of the drug, however, the values return to normal.
