NISTAGMO CIRCOLARE

IL NISTAGMO

Il nistagmo è un movimento oscillatorio, involontario, rapido e ripetitivo degli occhi; i quali possono muoversi in verticale, in orizzontale o ruotare.

Può essere fisiologico o patologico.

● *Quello PATOLOGICO è provocato da una disfunzione delle aree del cervello che controllano i movimenti oculari e può interessare uno o entrambi gli occhi. Spesso le persone colpite non sono consapevoli dei loro movimenti oculari: la visione può essere alterata a seconda della gravità del disturbo.*

Spesso può essere accompagnato da altri sintomi come nausea, mal di testa, vertigini e perdita di equilibrio.

Si parla di nistagmo PENDOLARE nel caso in cui le oscillazioni siano a velocità costante tra un capo e l'altro dell'occhio, o di nistagmo A SCOSSE se i movimenti sono inizialmente lenti e poi diventano rapidi quando l'occhio ritorna alla posizione iniziale.

● *Il nistagmo FISILOGICO avviene nei soggetti sani ed è parte del riflesso vestibolo-oculare, che stabilizza le immagini sulla retina durante un rapido movimento della testa. Questo può essere ulteriormente suddiviso in nistagmo OPTOCINETICO, che dipende dall'oscillazione VESTIBOLARE relativa all'orecchio interno. Il nistagmo*
