No Wasted Water

No Problem

Got Hard Water?

Hard water can leave stains on your fixtures, damage your appliances, and make your skin and hair feel dry and itchy. But now there's a solution: our salt-free water conditioners.

Our water conditioners use the latest technology to transform hard water into conditioned, clean, and healthy water for your home, without the need for salt.

Our conditioners don't use salt or chemicals, which makes them an eco-friendly solution to hard water problems. And they're easy to install and maintain so that you can enjoy soft water's benefits with minimal effort.

Nucleation Assisted Crystallization

Instead of removing the minerals from the water (like a traditional water softener), our salt-free conditioners alter the chemical structure of the minerals in the water, making them less likely to stick to surfaces and cause buildup.

The conditioner contains a special material that acts as a template or "seed" for the minerals in the water. When the water passes through the conditioner, the minerals are attracted to the template and form tiny crystals that are then carried away by the water.
