

Build Instructions

These instructions cover many of the LOC and PML kits. Your kit may look different than what is shown, but the assembly procedure is the same.

Due to the high thrust motors that can be flown in this rocket, epoxy is recommended!

Before beginning construction, read over instructions to become familiar with the proper construction steps. Check Parts List to make sure you have all the parts.

TEST FIT ALL PARTS! Light sanding may be necessary to obtain proper fit.

ITEMS YOU WILL NEED TO BUILD THIS KIT

Epoxy – (5, 15 and 30 Minute Recommended)

Fine and Medium Sandpaper

Masking Tape

Pencil and Ruler

Cyanoacrylate Glue (Superglue)

Paint

Parts List

Check your parts before you begin your build!

- Pre-slotted main airframe
- Motor mount tube
- Airframe to MMT centering ring - (2)
- Notched airframe to MMT cent. ring
- Payload airframe*
- Airframe coupler tube*
- Coupler bulk plate*
- Coupler hardware set*
- Eyebolt
- Washer
- Nuts - (2)
- Nose cone
- Fins
- Parachute
- Kevlar® Tether
- Nylon Shock cord
- Fire Resistant Blanket**
- Rail Guides - (2)
- Decal sheet

*Kits with payload bays only.

** 3" and smaller diameter kits

Epoxy, paint, and motor not included.

Basic Construction FAQ

The major parts involved in each step are shown shaded at the beginning of that step. Areas where epoxy should be applied are shown as well.

Prep and Assembly

- Read and understand the instruction steps fully before you begin the step.
- ALWAYS sand the parts to be bonded with 100-120 grit sandpaper.
- We strongly recommend you dry-fit (assemble without gluing) all parts in each step BEFORE epoxying them together. Sand or adjust fit as needed before gluing.
- Most epoxies work fine. Use 5 or 15 minute depending on how quickly you feel you can complete the step. Use longer set-time epoxy if you're unsure.
- To make internal fillets to the fins deep up into the airframe, "load up" the end of a dowel with a blob of epoxy, then stick the dowel into the airframe and onto the fin joint you're working on. After depositing enough epoxy in this fashion, you can pull the dowel toward you, making a fillet with

the rounded edge of the dowel.

- Be sure to follow the "Do's & Don'ts" sheet provided with QT tubing.
- Fins do not need to be "shaped". Lightly sand the edges to remove any manufacturing burrs.

Painting/Finishing

- Before you paint the fins, scuff the entire surface with 220 grit sandpaper. This is easiest to do before mounting the fins.
- Plastic nosecone imperfections can be filled with plastic model kit putty.
- Stay with the same brand of paint throughout the process; primer, base color, accent colors, and clear coat. DO NOT skimp on the "shake the can for at least two minutes after the ball rattles" step! For the best finish, let each coat dry overnight and sand lightly with 320 or 400 grit sandpaper.
- Apply the last color coat as heavy as possible without running or sagging. Let the paint cure for at least 48 hours before handling!

- We recommend a clear coat of some sort to help protect the decals as well as "seal" their edges to help prevent them peeling off. When using any clear coat, put on only VERY thin, light coats, and wait at least 5 minutes between coats. The clear coat can damage your decals or paint if you put it on too heavily or don't wait long enough between coats!

Let's Get Started!

STEP 1 - Pre-assembly Fitting and Sanding

The first few steps are going to involve scuffing, sanding and fitting some of the parts to your kit. The time you spend in the pre-assembly/fitting stage will aid in making assembly smooth when the adhesives come into play. Take your time here to get things right.

Image above shows the 1) Motor Tube, 2) FWD Notched Centering Ring, and two Mid and AFT Standard Centering Rings (3/4).

A. Lightly scuff/sand the motor tube to ensure proper adhesion of epoxy.

B. Dry fit all centering rings into the airframe and over the motor mount tube. The FWD notched ring and MID standard ring can be a little snug in the airframe and on the motor tube. If it is too tight, sand the ID and/or OD for a better fit.

C. Use a pencil to mark the AFT centering ring for identification. *You do not want to switch the MID and AFT centering rings during assembly!* The AFT standard centering ring should be looser in the airframe and over the motor mount tube; you will need to slip the AFT centering off the motor tube while it is in the airframe during a later step. Sand the ID and/or OD for a loose fit if necessary.

STEP 2 - More Pre-assembly Fitting and Sanding

A. Slip the MID then AFT centering ring over the motor tube. Make a 3/8" strip of masking tape and apply onto the AFT end of the motor tube. Slip the AFT ring down so it butts up against the tape.

B. Dry fit the fins between the AFT centering ring and the MID centering ring. This gives you an accurate location of where the mid centering ring should be placed. Using cyanoacrylate glue (super glue), lightly tack the MID centering ring in place.

**DO NOT GLUE THE FINS TO THE TUBE,
DO NOT GLUE THE AFT RING IN PLACE!**

C. Locate the FWD notched centering ring 1/2" from the FWD end of the motor tube. Tack in place using cyanoacrylate glue.

STEP 2 - Dry Fit Motor Tube Assembly to Airframe

A. Dry fit (NO EPOXY!) the motor tube/centering ring assembly into the airframe.

B. Make sure the MID and AFT centering rings do not interfere with the fin slots.

C. Dry fit a fin into each fin slot to make sure they fit correctly.

D. Make three or four cellophane tape tabs and apply to the AFT centering ring as shown above to aid in removing this ring at a later step.

E. Dry fit/test the fit of the aft ring over the motor tube. You need to be able to slip this ring on and off during final motor tube/airframe assembly.

Once you are satisfied with the fit of all the components, remove the motor tube assembly from the airframe. Remove the AFT centering ring from the motor tube.

STEP 3 - Kevlar® Tether and Centering Ring Fillets

The moment you've been waiting for! Get ready to use some epoxy.

A. Spread a layer of epoxy about 1" wide and 4" long on the motor tube just below the notch in the upper centering ring. Slip the raw end of the Kevlar® tether through the notch in the centering ring. Pull through about 4" of this strap through the notch and

press it firmly into the epoxy on the side of the motor tube. Hold the strap in place against the tube with masking tape until the epoxy cures. When cured, remove the masking tape.

B. Mix another batch of epoxy and coat the shock cord. Fill the entire centering ring notch with epoxy.

C. Make an epoxy fillet on the topside of the FWD notched centering ring and the MID centering ring.

D. When the epoxy has cured, flip the motor tube over and apply an epoxy fillet to the backside of the FWD centering ring only.

DO NOT make an epoxy fillet on the backside of the MID centering ring!

STEP 3 - Motor Tube to Airframe Assembly

A. Coil the Kevlar® tether and shove it into the motor tube to protect it during the next steps.

Lay your motor tube alongside the airframe and make a mark where your FWD and MID centering rings will rest when installed. Scuff/sand the **inside** of the airframe where the centering rings will rest when installed.

B. You will need a long stick or dowel for applying epoxy in this step. Make two marks on the stick at so you can tell how deep the stick is in the airframe when spreading the epoxy. Using your extended epoxy applicator, spread a bead of epoxy around the inside circumference of the airframe where the FWD and MID centering rings will rest.

DO NOT APPLY EPOXY WHERE THE AFT CENTERING RING WILL REST!!! You will need to slip the AFT centering ring off the motor tube in a future step. Push the motor tube assembly into the airframe. **The motor mount tube must be protruding 3/8" from the face of the AFT centering ring!**

Make sure the MID and AFT centering rings do not interfere with the fin slots. Flip the airframe to a vertical position (FWD end up) and let the epoxy cure.

STEP 4 - Fin to Airframe Assembly

A. Apply a bead of epoxy to the root edge of one fin tab and insert fin into fin slot.

Make sure the fin is at a right angle (90°) to the airframe. Set aside to cure. Keep the airframe in a horizontal position until the epoxy cures. Do one fin at a time, and let cure; then move on to the second fin and repeat the epoxy process. Repeat with the last remaining fin.

B. Gently pull the AFT centering ring off the end of the rocket by tugging on the tape tabs. Place tape over the end of the motor tube to protect it during the next step.

Do not get epoxy inside the motor tube!

C. Using a stick, apply an epoxy fillet to the fins at the motor mount tube and the inner airframe wall.

D. Remove the tape tabs from the centering ring and permanently epoxy it in the base of the rocket. **The motor tube must protrude 3/8" from the face of the centering ring!**

E. Apply an outer epoxy fillet to both sides of each fin. Allow the epoxy to set up before rotating the rocket to do the next set of fins. Once the epoxy has fully cured, you should sand the fillet smooth with fine sandpaper.

LOC PRO Build Tip! Adjustable Density Expanding Foam

Two-part expanding foam, great for fin encapsulation, securing loose weight, etc. By combining equal parts of A and B, the foam expands to about 10 times its original liquid volume. The result is a rigid foam that is extremely strong and still relatively lightweight. This is perfect for filling small spaces where the highest strength is required and weight is not a real issue. [Go here!](#)

A

B

C

STEP 4 - Bulkhead Assembly

A. Assemble the bulkhead as shown in the drawing.

- Slip a washer over the eyebolt
- Push the eye bolt into the hole in the bulkplate.
- Slip the second washer onto the eye bolt.
- Thread the nut on to the eye bolt and tighten it with a wrench.
- Spread epoxy over the nut and washers for a secure connection.

B. Spread a layer of epoxy around the inside circumference of the coupler to a depth of about 1/2".

Push the bulkhead assembly into the coupler until it is about 1/4" past the edge. Allow the epoxy to set. Then apply an epoxy fillet to both sides of the bulkhead.

C. Draw a pencil mark at the midpoint of the coupler. Spread a layer of epoxy around the inside circumference of the payload section tube to a depth of 1/2 of the tube diameter. With a slow twisting motion, push the coupler into the payload section tube up to the pencil mark. Allow the epoxy to cure.

STEP 5 - Nosecone Payload Bay Assembly

A

A. Slip the nosecone into the top of the payload section tube. Secure the nosecone to the payload section with 3 small screws or removable plastic rivets equally spaced around the circumference of the payload section tube about 1" below the nosecone. Be sure to pre-drill holes of the appropriate size when using screws. 1/4" long sheet metal screws work well in this application. If you prefer to use PML Removable Plastic Rivets (RVT-24), you will need to drill 5/32" diameter holes.

B

B. Next drill a 1/8" or 5/32" hole near the base of the payload section tube completely through the coupler. This hole is needed for high speed, high altitude flights to bleed off internal air pressure.

STEP 6 - Parachute / Recovery System Assembly

Make a parachute loop in the nylon shock cord 1/3 of the way from one end. Tie the **long** end of the shock cord onto the yellow Kevlar® tether. Attach the **short** end of the shock cord to the eye bolt in the payload

bay bulkhead. Most builders use a quick link (not included) for this purpose. A quick link makes it easy to change out shock cords if needed.

STEP 7 - Rail Guides Installation

A. Install the rail guides into the booster with provided screws. Drill a small hole at the location of the forward and aft centering rings, centered between fin set.

B. Drop a small amount of epoxy in drilled holes, thread the rail guides and screws in the holes, rotate rocket 180 degrees and let cure.

STEP 9 - Paint / Finish

Seal fins and launch lug with sanding sealer using a brush. Sand lightly between coats to fill pores and obtain a smooth finish. Lightly sand plastic nose cone with fine sandpaper to remove molding seam line. At this time, remove any plastic flash that was molded into the nose cone eyelet.

When you are satisfied with the smooth sanded finish of your model, it is ready to prime and paint.

- Spray rocket with primer, sand and repeat until smooth finish is obtained
- Spray rocket with paint of choice, let dry.
- Apply protective clear coat
- Apply vinyl decals to your liking
- Repeat with clear coat.

Model Rocket Safety Code

Materials – I will use only lightweight, non-metal parts for the nose, body, and fins of my rocket.

Motors – I will use only certified, commercially made model rocket motors, and will not tamper with these motors or use them for any purposes except those recommended by the manufacturer.

Ignition System – I will launch my rockets with an electrical launch system and electrical motor igniters. My launch system will have a safety interlock in series with the launch switch, and will use a launch switch that returns to the “off” position when released.

Misfires – If my rocket does not launch when I press the button of my electrical launch system, I will remove the launcher’s safety interlock or disconnect its battery, and will wait 60 seconds after the last launch attempt before allowing anyone to approach the rocket.

Launch Safety – I will use a countdown before launch, and will ensure that everyone is paying attention and is a safe distance of at least 15 feet away when I launch rockets with D motors or smaller, and 30 feet when I launch larger rockets. If I am uncertain about the safety or stability of an untested rocket, I will check the stability before flight and will fly it only after warning spectators and clearing them away to a safe distance. When conducting a simultaneous launch of more than ten rockets, I will observe a safe distance of 1.5 times the maximum expected altitude of any launched rocket.

Launcher – I will launch my rocket from a launch rod, tower, or rail that is pointed to within 30 degrees of the vertical to ensure that the rocket flies nearly straight up, and I will use a blast deflector to prevent the motor’s exhaust from hitting the ground. To prevent accidental eye injury, I will place launchers so that the end of the launch rod is above eye level or will cap the end of the rod when it is not in use.

Size – My model rocket will not weigh more than 1,500 grams (53 ounces) at liftoff and will not contain more than 125 grams (4.4 ounces) of propellant or 320 N-sec (71.9 pound-seconds) of total impulse.

Flight Safety – I will not launch my rocket at targets, into clouds, or near airplanes, and will not put any flammable or explosive payload in my rocket.

Launch Site – I will launch my rocket outdoors, in an open area at least as large as shown in the accompanying table, and in safe weather conditions with wind speeds no greater than 20 miles per hour. I will ensure that there is no dry grass close to the launch pad, and that the launch site does not present risk of grass fires.

Recovery System – I will use a recovery system such as a streamer or parachute in my rocket so that it returns safely and undamaged and can be flown again, and I will use only flame-resistant or fireproof recovery system wadding in my rocket.

Recovery Safety – I will not attempt to recover my rocket from power lines, tall trees, or other dangerous places.

Launch Site Dimensions

Installed Total Impulse (N-sec)	Equivalent Motor Type	Minimum Site Dimensions (Ft.)
0.00 – 1.25	1/4A, 1/2A	50'
1.26 – 2.50	A	100'
2.51 – 5.00	B	200'
5.01 – 10.00	C	400'
10.01 – 20.00	D	500'
20.01 – 40.00	E	1,000'
40.01 – 80.00	F	1,000'
80.01 – 160.00	G	1,000'
160.01 – 320.00	Two G's	1,500'
