

PERDIX Rat Trapping Tunnel Instructions

The PERDIX[®] Rat trapping tunnel has been design to improve trapping efficiency and humaneness and also prevent non-target captures. Using a unique combination of wire mesh baffles, a pre-baiting system and two powerful KORO rodent traps, our Rat trapping tunnel is ideal for controlling Rats in any environment.

How it works

The central area of the tunnel is designed to be used as a bait dispenser to allow pre-baiting prior to settings the traps. Once Rats are taking the bait, the two KORO rodent traps can be placed in the tunnel to quickly catch the visiting animals. By pre-baiting and then being able to set two traps in the same set, the PERDIX[®] rat trapping tunnel can vastly improve trapping efficiency (Figure 1).

Trapping

To prevent non-target captures, each trapping tunnel is equipped olive drab steel guards at each end. These can, however, be removed for cleaning or when pre-baiting. The tunnels also have an internal baffle in front of each trap to ensure Rats are positioned correctly when stuck by the trap and therefore killed humanely. Make sure the treadle plate of the trap is positioned in front of the opening in the baffle (Figure 5).

Access & Security

A double hinged lid allows for quick and easy access to the bait compartment and traps. The lid is securely closed using a strong hasp and carbine hook. For additional security, a padlock (not supplied) could be used.

THE PERDIX RAT TRAPPING TUNNEL INCLUDES:

- 1 x treated wooden tunnel complete with hasp
- 2 x steel baiting compartment inserts plated in olive drab
- 2 x steel end inserts plated in olive drab
- 2 x steel baffles inserts plated in olive drab
- 2 x powerful KORO rodent traps
- 1 x carbine hook
- Instruction sheet
