

# Light Kit Information

**NOTE: All VBurst! frames are constructed of Quads. A 3X3, as shown at right, is 3Quads wide and 3Quads high. It can accept up to three lights across the top of the frame.**

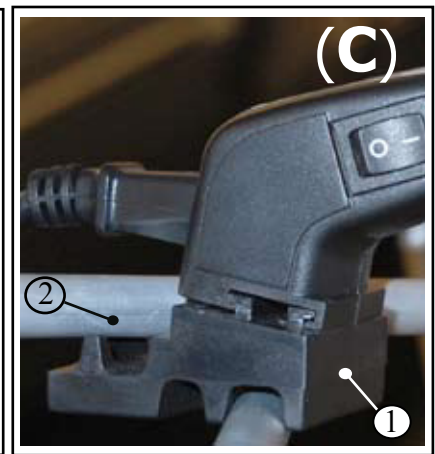

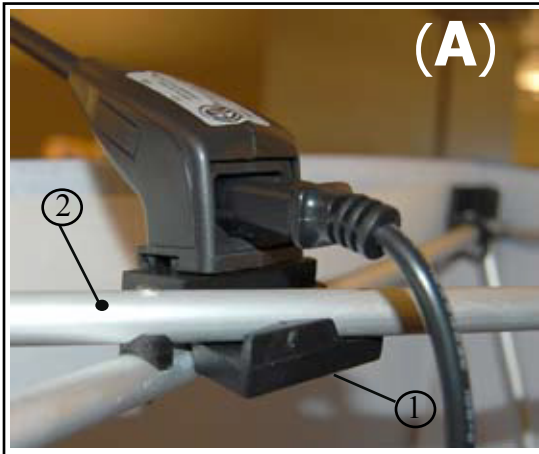

**A 2X3 VBurst! accepts up to two lights accross the top of the frame.**

**A 4X3 VBurst! accepts up to four lights across the top of the frame.**

**Lights do not link together electrically, each light requires a single outlet.**

Above: VBurst! 3X3 with two lights.

**(A) VBurst lights fit within the front and back Quad scissors at the top of the display. The grooves in the base of the light ① fit onto the scissor bars ②. The front of the base sits over the front bar and the back of the base sits underneath the back bar. Start by feeding the base in from the front of the display by tilting slightly then lowering the base into place.**

**(B) From the back you can see how the base of the light fits over and under the scissor bars. Also, the power plug drapes over the back bar to the outlet.**

**(C) The side view shows again how the base of the light ① rests on the front and back scissor bars ②. You can also see the power switch that is located on the side. Plug the lights in then switch them on.**
