## COMPUTER SCIENCE (CS)

Q.1. The Lucas sequence $L_{n}$ is defined by the recurrence relation:
$L_{n}=L_{n-1}+L_{n-2}$, for $n \geq 3$, with $L_{1}=1$ and $L_{2}=3$.
Which one of the options given is TRUE?
(a) $L_{n}=\left(\frac{1+\sqrt{5}}{2}\right)^{n}+\left(\frac{1-\sqrt{5}}{2}\right)^{n}$
(b) $L_{n}=\left(\frac{1+\sqrt{5}}{2}\right)^{n}-\left(\frac{1-\sqrt{5}}{3}\right)^{n}$
(c) $L_{n}=\left(\frac{1+\sqrt{5}}{2}\right)^{n}+\left(\frac{1-\sqrt{5}}{3}\right)^{n}$
(d) $L_{n}=\left(\frac{1+\sqrt{5}}{2}\right)^{n}-\left(\frac{1-\sqrt{5}}{2}\right)^{n}$
Q. 2. Let $A=\left[\begin{array}{llll}1 & 2 & 3 & 4 \\ 4 & 1 & 2 & 3 \\ 3 & 4 & 1 & 2 \\ 2 & 3 & 4 & 1\end{array}\right]$ and $B=\left[\begin{array}{llll}3 & 4 & 1 & 2 \\ 4 & 1 & 2 & 3 \\ 1 & 2 & 3 & 4 \\ 2 & 3 & 4 & 1\end{array}\right]$

Let $\operatorname{det}(A)$ and $\operatorname{det}(B)$ denote the determinants of the matrices $A$ and $B$, respectively. Which one of the options given below is TRUE?
(a) $\operatorname{det}(A)=\operatorname{det}(B)$
(b) $\operatorname{det}(B)=-\operatorname{det}(A)$
(c) $\operatorname{det}(A)=0$
(d) $\operatorname{det}(A B)=\operatorname{det}(A)+\operatorname{det}(\mathrm{B})$
Q.3. Let $f(x)=x^{3}+15 x^{2}-33 x-36$ be a real-valued function.

Which of the following statements is/are TRUE?
(a) $f(x)$ does not have a local maximum.
(b) $f(x)$ has a local maximum.
(c) $f(x)$ does not have a local minimum.
(d) $f(x)$ has a local minimum.
Q.4. Let $f$ and $g$ be functions of natural numbers given by $f(n)=n$ and $g(n)=n^{2}$.
Which of the following statements is/are TRUE?
(a) $f \in \mathrm{O}(g)$
(b) $f \in \Omega(g)$
(c) $f \in \mathrm{o}(g)$
(d) $f \in \theta(g)$
Q. 5. Let $A$ be the adjacency matrix of the graph with vertices $\{1,2,3,4,5\}$.

Let $\lambda_{1}, \lambda_{2}, \lambda_{3}, \lambda_{4}$, and $\lambda_{5}$ be the five eigen values of $A$. Note that these eigen values need not be distinct.
The value of $\lambda_{1}+\lambda_{2}+\lambda_{3}+\lambda_{4}+\lambda_{5}=$ $\qquad$ -
Q.6. The value of the definite integral
$\int_{-3}^{3} \int_{-2}^{2} \int_{-1}^{1}\left(4 x^{2} y-z^{3}\right) d z d y d x$ is $\qquad$ -
(Rounded off to the nearest integer)
Q. 7. Let $U=\{1,2, \ldots, n\}$, where n is a large positive integer greater than 1000 . Let $k$ be a positive integer less than $n$. Let $A, B$ be subsets of $U$ with $|A|=|B|=k$ and $\mathrm{A} \cap \mathrm{B}=\phi$.
We say that a permutation of $U$ separates $A$ from $B$ if one of the following is true.
(a) $n$ !
(b) $\binom{n}{2 k}(n-2 k)$ !
(c) $\binom{n}{2 k}(n-2 k)!(k!)^{2}$
(d) $2\binom{n}{2 k}(n-2 k)!(k!)^{2}$
Q. 8. Let $f: \mathrm{A} \rightarrow \mathrm{B}$ be an onto (or surjective) function, where $A$ and $B$ are non-empty sets. Define an equivalence relation - on the set $A$ as

$$
a_{1} \sim a_{2} \text { if } f\left(a_{1}\right)=f\left(a_{2}\right)
$$

where $a_{1}, a_{2} \in A$. Let $\in=\{[x]: x \in A\}$ be the set of all the equivalence classes under $\sim$. Define a new mapping $F: \in \rightarrow B$ as
$F([x])=f(x)$, for all the equivalence classes $[x]$ in $\in$.
Which of the following statements is/are TRUE?
(a) F is NOT well-defined.
(b) F is an onto (or surjective) function.
(c) F is a one-to-one (or injective) function.
(d) F is a bijective function.
Q. 9. Let $X$ be a set and $2^{X}$ denote the power set of X.

Define a binary operation $\Delta$ on $2^{X}$ as follows:

$$
A \Delta B=(A-B) \cup(B-A)
$$

Let $H=\left(2^{X}, \Delta\right)$. Which of the following statements about $H$ is/are correct?
(a) $H$ is a group.
(b) Every element in $H$ has an inverse, but $H$ is NOT a group.
(c) For every $A \in 2^{X}$, the inverse of $A$ is the complement of $A$.
(d) For every $A \in 2^{X}$, the inverse of $A$ is $A$.
Q. 10. Consider a random experiment where two fair coins are tossed. Let $A$ be the event that denotes HEAD on both the throws, $B$ be the event that denotes HEAD on the first throw, and $C$ be the event that denotes HEAD on the second throw. Which of the following statements is/are TRUE?
(a) $A$ and $B$ are independent.
(b) $A$ and $C$ are independent.
(c) $B$ and $C$ are independent.
(d) $\operatorname{Prob}(B \mid C)=\operatorname{Prob}(B)$
Q. 11. Let $G$ be a simple, finite, undirected graph with vertex set $\left\{v_{1}, \ldots, v_{n}\right\}$. Let $\Delta(G)$ denote the maximum degree of $G$ and let $N=\{1,2, \ldots\}$ denote the set of all possible colors. Color the vertices of $G$ using the following greedy strategy:
for $i=1, \ldots, n$
$\operatorname{color}\left(v_{i}\right) \leftarrow \min \left\{j \in N:\right.$ no neighbour of $v_{i}$ is colored $j\}$
Which of the following statements is/are TRUE?
(a) This procedure results in a proper vertex coloring of $G$.
(b) The number of colors used is at most $\Delta(G)+1$
(c) The number of colors used is at most $\Delta(G)$.
(d) The number of colors used is equal to the chromatic number of $G$.
Q. 12. Let $U=\{1,2,3\}$. Let $2^{U}$ denote the power set of $U$. Consider an undirected graph $G$ whose vertex set is $2^{U}$. For any $A, B \in 2^{U},(A, B)$ is an edge in $G$ if and only if (i) $A \neq B$, and (ii) either $A \subseteq B$ or $B \subseteq A$. For any vertex $A$ in $G$, the set of all possible orderings in which the vertices of $G$ can be visited in a Breadth First Search (BFS) starting from $A$ is denoted by $B(A)$.
If $\phi$ denotes the empty set, then the cardinality of $B(\phi)$ is $\qquad$ _.

## MECHANICAL ENGINEERING (ME)

Q. 13. The figure shows the plot of a function over the interval $[-4,4]$. Which one of the options given CORRECTLY identifies the function?

(a) $|2-x|$
(b) $|2-|x||$
(c) $|2+|x||$
(d) $2-|x|$
Q.14. Which one of the options given represents the feasible region of the linear programming model:
Maximize $45 x_{1}+60 X_{2}$

$$
x_{1} \leq 45
$$

$$
x_{2} \leq 50
$$

$$
10 x_{1}+10 x_{2} \geq 600
$$

$$
25 x_{1}+5 x_{2} \geq 750
$$

(a) Region P
(b) Region Q
(c) Region R
(d) Region $S$
Q. 15. A vector field

$$
B(x, y, z)=x \hat{i}+y \hat{j}-2 z \hat{k}
$$

is defined over a conical region having height $h=2$, base radius $r=3$ and axis along $z$, as shown in the figure. The base of the cone lies in the $x-y$ plane and is centered at the origin. If $n$ denotes the unit outward normal to the curved surface $S$ of the cone, the value of the integral.

$$
\int_{S} B \cdot n d S
$$

equal $\qquad$ . [answer in integer]

Q. 16. A linear transformation maps a point $(x, y)$ in the plane to the point $(\hat{x}, \hat{y})$ according to the rule

$$
\hat{x}=3 y, \hat{y}=2 x
$$

Then, the disc $x^{2}+y^{2} \leq 1$ gets transformed to a region with an are equal to $\qquad$ . (Rounded off to two decimals) Use $\pi=3.14$.
Q. 17. The value of $k$ that makes the complex-valued function

$$
f(z)=e^{-k x}(\cos 2 y-i \sin 2 y)
$$

analytic, where $z=x+i y$, is $\qquad$ [Answer in integer]
Q. 18. Which one of the options given is the inverse Laplace transform of $\frac{1}{S^{3}-S}$ ? $u(t)$ denotes the unit-step function.
(a) $\left(-1+\frac{1}{2} e^{-t}+\frac{1}{2} e^{t}\right) u(t)$
(b) $\left(\frac{1}{3} e^{-t}-e^{t}\right) u(t)$
(c) $\left(-1+\frac{1}{2} e^{-(t-1)}+\frac{1}{2} e^{(t-1)}\right) u(t-1)$
(d) $\left(-1-\frac{1}{2} e^{-(t-1)}-\frac{1}{2} e^{(t-1)}\right) u(t-1)$
Q. 19. The smallest perimeter that a rectangle with area of 4 square units can have is $\qquad$ units. (Answer in integer)
Q. 20. Consider the second-order linear ordinary differential equation

$$
x^{2} \frac{d^{2} y}{d x^{2}}+x \frac{d y}{d x}-y=0, x \geq 1
$$

with the initial conditions

$$
y(x=1)=6,\left.\frac{d y}{d x}\right|_{x=1}=2
$$

the value of $y$ at $x=2$ equals $\qquad$ . [Answer in integer]
Q. 21. The initial value problem

$$
\frac{d y}{d t}+2 y=0, y(0)=1
$$

is solved numerically using the forward Euler's method with a constant and positive time step of $\Delta t$.
Let $Y_{n}$ represent the numerical solution obtained after $n$ steps. The condition $\left|y_{n+1}\right| \leq\left|y_{n}\right|$ is satisfied if and only if .tit does not exceed $\qquad$ . (Answer in integer)

## ELECTRICAL ENGINEERING (EE)

Q. 22. For a given vector $w=\left[\begin{array}{lll}1 & 2 & 3\end{array}\right]^{T}$, the vector normal to the plane defined by $\mathrm{w}^{T} \mathrm{x}=1$ is
(a) $\left[\begin{array}{lll}-2 & -2 & 2\end{array}\right]^{T}$
(b) $\left[\begin{array}{lll}3 & 0 & -1\end{array}\right]^{T}$
(c) $\left[\begin{array}{lll}3 & 2 & 1\end{array}\right]^{T}$
(d) $\left[\begin{array}{lll}1 & 2 & 3\end{array}\right]^{T}$
Q. 23. The Fourier transform $X(\omega)$ of the signal $x(t)$ is given by

$$
\begin{aligned}
X(\omega) & =1, \text { for }|\omega|<W_{0} \\
& =0, \text { for }|\omega|>W_{0}
\end{aligned}
$$

Which one of the following statements is true?
(a) $x(t)$ tends to be an impulse as $W_{0} \rightarrow \infty$.
(b) $x(0)$ decreases as $W_{0}$ increases.
(c) At $t=\frac{\pi}{2 W_{0}}, x(t)=-\frac{1}{\pi}$
(d) At $t=\frac{\pi}{2 W_{0}}, x(t)=\frac{1}{\pi}$
Q. 24. The Z-transform of a discrete signal $x[n]$ is

$$
X(z)=\frac{4 z}{\left(z-\frac{1}{5}\right)\left(z-\frac{2}{3}\right)(z-3)} \text { with ROC }=R
$$

Which one of the following statements is true?
(a) Discrete-time Fourier transform of $x[n]$ converges if $R$ is $|z|>3$.
(b) Discrete-time Fourier transform of $x[n]$ converges if $R$ is $\frac{2}{3}<|z|<3$.
(c) Discrete-time Fourier transform of $x[n]$ converges if $R$ is such that $x[n]$ is a leftsided sequence.
(d) Discrete-time Fourier transform of $x[n]$ converges if $R$ is such that $x[n]$ is a right sided sequence.
Q. 25. In the figure, the vectors $\mathbf{u}$ and $\mathbf{v}$ are related as: $\mathbf{A u}=\mathbf{v}$ by a transformation matrix $\mathbf{A}$. The correct choice of $\mathbf{A}$ is

(a) $\left[\begin{array}{cc}\frac{4}{5} & \frac{3}{5} \\ -\frac{3}{5} & \frac{4}{5}\end{array}\right]$
(b) $\left[\begin{array}{cc}\frac{4}{5} & -\frac{3}{5} \\ \frac{3}{5} & \frac{4}{5}\end{array}\right]$
(c) $\left[\begin{array}{ll}\frac{4}{5} & \frac{3}{5} \\ \frac{3}{5} & \frac{4}{5}\end{array}\right]$
(d) $\left[\begin{array}{rr}\frac{4}{5} & -\frac{3}{5} \\ \frac{3}{5} & -\frac{4}{5}\end{array}\right]$
Q. 26. Three points in the $x-y$ plane are $(-1,0.8)$, $(0,2.2)$ and $(1,2.8)$. The value of the slope of the best fit straight line in the least square sense is $\qquad$ (Round off to 2 decimal places).
Q. 27. Consider the following equation in a 2-D real-space.

$$
\left|x_{1}\right|^{p}+\left|x_{2}\right|^{p}=1 \text { for } p>0
$$

Which of the following statement(s) is/are true.
(a) When $p=2$, the area enclosed by the curve is $\pi$.
(b) When $p$ tends to $\infty$, the area enclosed by the curve tends to 4 .
(c) When $p$ tends to 0 , the area enclosed by the curve is 1 .
(d) When $p=1$, the area enclosed by the curve is 2 .
Q. 28. Consider the state-space description of an LTI system with matrices

$$
A=\left[\begin{array}{cc}
0 & 1 \\
-1 & -2
\end{array}\right], B=\left[\begin{array}{l}
0 \\
1
\end{array}\right], C=\left[\begin{array}{ll}
3 & -2
\end{array}\right], D=1
$$

For the input, $\sin (\omega t), \omega>0$, the value of $\omega$ for which the steady-state output of the system will be zero, is $\qquad$ (Round off to the nearest integer).
Q. 29. The discrete-time Fourier transform of a signal $x[n]$ is $X(\Omega)=(1+\cos \Omega) e^{-j \Omega}$. Consider that $x_{p}[n]$ is a periodic signal of period $N=5$ such that

$$
\begin{aligned}
x_{p}[n] & =x[n], \text { for } n=0,1,2 \\
& =0, \text { for } n=3,4
\end{aligned}
$$

Note that $x_{p}[n]=\sum_{k=0}^{N-1} a_{k} e^{j \frac{2 \pi}{N} k n}$. The magnitude of the Fourier series coefficient $a_{3}$ is $\qquad$ (Round off to 3 decimal places).
Q.30. The closed curve shown in the figure is described by $r=1+\cos \theta$,
where $r=\sqrt{x^{2}+y^{2}} ; x=r \cos \theta, y=r \sin \theta$. The magnitude of the line integral of the vector field $F=-y \hat{i}+x \hat{j}$ around the closed curve is $\qquad$ (Round off to 2 decimal places).

Q. 31. A quadratic function of two variables is given as $f\left(x_{1}, x_{2}\right)=x_{1}^{2}+2 x_{2}^{2}+3 x_{1}+3 x_{2}+x_{1} x_{2}+1$

The magnitude of the maximum rate of change of the function at the point $(1,1)$ is
$\qquad$ (Round off to the nearest integer).

## ELECTRONICS COMMUNICATION (EC)

Q. 32. Let $V_{1}=\left[\begin{array}{l}1 \\ 2 \\ 0\end{array}\right]$ and $V_{2}=\left[\begin{array}{l}2 \\ 1 \\ 3\end{array}\right]$ be two vectors. The value of the coefficient $\alpha$ in the expression $V_{1}=\alpha V_{2}+e$, which minimizes the length of the error vector $e$, is
(a) $\frac{7}{2}$
(b) $-\frac{2}{7}$
(c) $\frac{2}{7}$
(d) $-\frac{7}{2}$
Q. 33. The rate of increase, of a scalar field $f(x, y, z)$ $=x y z$ in the direction $v=(2,1,2)$ at a point $(0,2,1)$ is
(a) $\frac{2}{3}$
(b) $\frac{4}{3}$
(c) 2
(d) 4
Q. 34. Let $w^{4}=16 j$. Which of the following cannot be a value of $w$ ?
(a) $2 e^{\frac{j 2 \pi}{8}}$
(b) $2 e^{\frac{j \pi}{8}}$
(c) $2 e^{\frac{j 5 \pi}{8}}$
(d) $2 e^{\frac{j 9 \pi}{8}}$
Q.35. The value of the contour integral, $\oint_{c}\left(\frac{z+2}{z^{2}+2 z+2}\right) d z$ where the contour $C$ is $\left\{z:\left|z+1-\frac{3}{2} j\right|=1\right\}$ taken in the counter clockwise direction, is
(a) $-\pi(1+j)$
(b) $\pi(1+j)$
(c) $\pi(1-j)$
(d) $-\pi(1-j)$
Q.36. Let the sets of eigenvalues and eigenvectors of a matrix B be $\left\{\lambda_{k} \mid 1 \leq k \leq n\right\}$ and $\left\{v_{k} \mid 1 \leq k\right.$ $\leq n\}$, respectively. For any invertible matrix $P$, the sets of eigenvalues and eigenvectors of the matrix $A$, where $B=P^{-1} A P$, respectively, are
(a) $\left\{\lambda_{k} \operatorname{det}(A) \mid 1 \leq k \leq n\right\}$ and $\left\{P v_{k} \mid 1 \leq k \leq n\right\}$
(b) $\left\{\lambda_{k} \mid 1 \leq k \leq n\right\}$ and $\left\{v_{k} \mid 1 \leq k \leq n\right\}$
(c) $\left\{\lambda_{k} \mid 1 \leq k \leq n\right\}$ and $\left\{P v_{k} \mid 1 \leq k \leq n\right\}$
(d) $\left\{\lambda_{k} \mid 1 \leq k \leq n\right\}$ and $\left\{P^{-1} v_{k} \mid 1 \leq k \leq n\right\}$
Q. 37. The Fourier transform $X(\omega)$ of $x(t)=e^{-t^{2}}$ is

Note: $\int_{-\infty}^{\infty} e^{-y^{2}} d y=\sqrt{\pi}$
(a) $\sqrt{\pi} e^{\frac{\omega^{2}}{2}}$
(b) $\frac{e^{-\frac{\omega^{2}}{4}}}{2 \sqrt{\pi}}$
(c) $\sqrt{\pi} e^{-\frac{\omega^{2}}{4}}$
(d) $\sqrt{\pi} e^{-\frac{\omega^{2}}{2}}$
Q.38. The value of the line integral $\int_{P}^{Q}\left(z^{2} d x+3 y^{2} d y+2 x z d z\right)$ along the straight line joining the points $P(1,1,2)$ and $Q(2,3,1)$ is:
(a) 20
(b) 24
(c) 29
(d) -5
Q.39. Let $x$ be an $n \times 1$ real column vector with length $l=\sqrt{x^{\mathrm{T}} x}$. The trace of the matrix $P=$ $x x^{T}$ is
(a) $l^{2}$
(b) $\frac{l^{4}}{4}$
(c) $l$
(d) $\frac{l^{2}}{2}$
Q.40. The value of the integral $\iint_{R} x y d x d y$ over the region $R$, given in the figure, is $\qquad$ . (rounded off to the nearest integer).

Q. 41. Let $x_{1}(t)=u(t+1.5)-u(t-1.5)$ and $x_{2}(t)$ is shown in the figure below. For $y(t)=$ $x_{1}(t) \bullet x_{2}(t)$, the $\int_{-\infty}^{\infty} y(t) d t \quad$ is $\qquad$ (rounded off to the nearest integer)

## INSTRUMENTATION ENGINEERING (IN)

Q. 42. Choose solution set $S$ corresponding to the systems of two equations

$$
\begin{array}{r}
x-2 y+z=0 \\
x-z=0
\end{array}
$$

Note: $\mathbf{R}$ denotes the set of real numbers
(a) $S=\left\{\left.\alpha\left(\begin{array}{l}1 \\ 1 \\ 1\end{array}\right) \right\rvert\, \alpha \in R\right\}$
(b) $S=\left\{\left.\alpha\left(\begin{array}{l}1 \\ 1 \\ 1\end{array}\right)+\beta\left(\begin{array}{l}1 \\ 0 \\ 1\end{array}\right) \right\rvert\, \alpha, \beta \in R\right\}$
(c) $S=\left\{\left.\alpha\left(\begin{array}{l}1 \\ 1 \\ 1\end{array}\right)+\beta\left(\begin{array}{l}2 \\ 1 \\ 2\end{array}\right) \right\rvert\, \alpha, \beta \in R\right\}$
(d) $S=\left\{\left.\alpha\left(\begin{array}{l}1 \\ 0 \\ 1\end{array}\right) \right\rvert\, \alpha \in R\right\}$
Q. 43. $F(z)=\frac{1}{1-z}$ when expanded as a power series around $z=2$, would result in $F(z)=\sum_{k=0}^{\infty} a_{k}(z-2)^{k} \quad$ with the region of convergence (ROC) $|z-2|<1$. The coefficients $a_{k} \geq 0$, are given by the expression
$\overline{(a)}(-1)^{k}$
(b) $(-1)^{k+1}$
(c) $\left(\frac{1}{2}\right)^{k}$
(d) $\left(\frac{-1}{2}\right)^{k+1}$
Q. 44. The solution $x(t), t \geq 0$, to the differential equation $\ddot{x}=-k \dot{x}, k>0$ with initial conditions

$$
x(0)=1 \text { and } \dot{x}(0)=0 \text { is }
$$

(a) $x(t)=2 \mathrm{e}^{-k t}+2 k t-1$
(b) $x(t)=2 \mathrm{e}^{-k t}+1$
(c) $x(t)=1$
(d) $x(t)=2 \mathrm{e}^{-k t}-k t-1$
Q.45. A system has the transfer-function $\frac{Y(s)}{X(s)}=\frac{s-\pi}{s+\pi}$. Let $u(t)$ be the unit-step function. The input $x$ ( that results in a steadystate output $y(t)=\sin \pi t$ is $\qquad$ -.
(a) $x(t)=\sin (p t) u(t)$
(b) $x(t)=\sin \left(\pi t+\frac{\pi}{2}\right) u(t)$
(c) $x(t)=\sin \left(\pi t-\frac{\pi}{2}\right) u(t)$
(d) $x(t)=\cos \left(\pi t+\frac{\pi}{2}\right) u(t)$
Q. 46. What is $\lim _{x \rightarrow \infty} f(x)$, where $f(x)=x \sin \frac{1}{x}$ ?
(a) 0
(b) 1
(c) $\infty$
(d) Limit does not exist
Q. 47. The number of zeros of the polynomial $P(s)$ $=s^{3}+2 s^{2}+5 s+80$ in the right-half plane is
$\qquad$ .
Q. 48. Let $y(t)=x(4 t)$, where $x(t)$ is a continuoustime periodic signal with fundamental period of 100s. The fundamental period of $y(t)$ is $\qquad$ $s$ (rounded off to the nearest integer).
Q.49. X is a discrete random variable which takes values 0,1 and 2 . The probabilities are $P(X=0)=0.25$ and $P(X=1)=0.5$. With $E[$. denoting the expectation operator, the value of $E[X]-\left[X^{2}\right]$ is $\qquad$ (rounded off to one decimal place).
Q. 50. The Laplace transform of the continuoustime signal $x(t)=e^{-3 t} u(t-5)$ is $\qquad$ , where $u(t)$ denotes the continuous-time unit step signal.
(a) $\frac{e^{-5 s}}{s+3}$, $\operatorname{Real}\{s\}>-3$
(b) $\frac{e^{-5(s-3)}}{s-3}$, Real $\{s\}>-3$
(c) $\frac{e^{-5(s+3)}}{s+3}$, Real $\{s\}>-3$
(d) $\frac{e^{-5(s-3)}}{s+3}$, Real $\{s\}>-3$
Q. 51. Let $f(z)=j \frac{1-z}{1+z}$, where $z$ denotes a complex number and $j$ denotes $\sqrt{-1}$. The inverse function $t^{-1}(z)$ maps the real axis to the $\qquad$ .
(a) unit circle with centre at the origin
(b) unit circle with centre not at the origin
(c) imaginary axis
(d) real axis
Q. 52. How many five-digit numbers can be formed using the integers $3,4,5$ and 6 with exactly one digit appearing twice?
Q.53. Five measurements are made using a weighing machine, and the readings are 80 $\mathrm{kg}, 79 \mathrm{~kg}, 81 \mathrm{~kg}, 79 \mathrm{~kg}$ and 81 kg . The sample standard deviation of the measurement is
$\qquad$ kg (rounded off to two decimal places).
Q. 54. Consider the real-valued function $g(x)=$ $\max \left\{(\mathrm{x}-2)^{2},-2 x+7\right\}$, where $x \in(-\infty, \infty)$. The minimum value attained by $g(x)$ is $\qquad$ (rounded off to one decimal place).
Q. 55. The rank of the matrix $A$ given below is one. The ratio $\frac{\alpha}{\beta}$ is $\qquad$ (rounded off to the nearest integer). $A=\left[\begin{array}{cc}1 & A \\ -3 & \alpha \\ \beta & 6\end{array}\right]$

## CHEMICAL ENGINEERING (CH)

Q. 56. Which one of the following is the CORRECT value of $y$, as defined by the expression given below?

$$
\hat{\mathrm{v}}=\lim _{x \rightarrow 0} \frac{2 x}{e^{x}-1}
$$

(a) 1
(b) 2
(c) 0
(d) $\infty$
Q. 57. The vector $\vec{v}$ is defined as

$$
\vec{v}=z x \hat{i}+2 x y \hat{j}+3 y z \hat{k}
$$

Which one of the following is the CORRECT value of divergence of $\vec{v}$, evaluated at the point $(x, y, 0)=(3,2,1)$ ?
(a) 0
(b) 3
(c) 14
(d) 13
Q. 58. Given that

$$
F=\frac{\left|z_{1}+z_{2}\right|}{\left|z_{1}\right|+\left|z_{2}\right|}
$$

where $z_{1}=2+3 i$ and $z_{2}=-2+3 i$ with $i=$ $\sqrt{-1}$ which one of the following options is CORRECT?
(a) $\mathrm{F}<0$
(b) $\mathrm{F}<1$
(c) $\mathrm{F}>0$
(d) $\mathrm{F}=1$
Q. 59. For a two-dimensional plane, the unit vectors, $\left(\hat{e}_{r}, \hat{e}_{\theta}\right)$ of the polar coordinate system and $(\hat{i}, \hat{j})$ of the cartesian coordinate system, are related by the following two equations.

$$
\begin{aligned}
& \hat{e}_{r}=\cos \theta \hat{i}+\sin \theta \hat{j} \\
& \hat{e}_{\theta}=-\sin \theta \hat{i}+\cos \theta \hat{j}
\end{aligned}
$$

Which one of the following is the CORRECT value of $\frac{\partial\left(\hat{e}_{r}+\hat{e}_{\theta}\right)}{\partial \theta}$ ?
(a) 1
(b) 8 a
(c) $\hat{e}_{r}+\hat{e}_{\theta}$
(d) $-\hat{e}_{r}+\hat{e}_{\theta}$
Q. 60. The position $x(t)$ of a particle, at constant $\omega$, is described by the equation

$$
\frac{d^{2} x}{d t^{2}}=-\omega^{2} x
$$

The initial conditions are $x(t=0)=1$ and $\left.\frac{d x}{d t}\right|_{t=0}=0$ then position of particle at $t=$ $\left(\frac{3 \pi}{\omega}\right)$ is $\qquad$ (in integer).
Q. 61 An exhibition was held in a hall on 15 August 2022 between 3 PM and 4 PM during which any person was allowed to enter only once. Visitors who entered before 3:40 PM exited the hall exactly after 20 minutes from their time of entry. Visitors who entered at or after 3:40 PM, exited exactly at 4 PM . The probability distribution of the arrival time of any visitor is uniform between 3 PM and 4 PM . Two persons $X$ and $Y$ entered the exhibition hall independent of each other. Which one of the following values is the probability that their visits to the exhibition overlapped with each other?
(a) $\frac{5}{9}$
(b) $\frac{4}{9}$
(c) $\frac{2}{9}$
(d) $\frac{7}{9}$
Q. 62. Simpson's one-third rule is used to estimate the definite integral

$$
I=\int_{-1}^{1} \sqrt{\left(1-x^{2}\right) d x}
$$

with an interval length of 0.5 . Which one of the following is the CORRECT estimate of $I$ obtained using this rule?
(a) $\frac{1}{3}-\frac{1}{\sqrt{3}}$
(b) $\frac{1}{3}+\frac{2}{\sqrt{3}}$
(c) $\frac{1}{3}+\frac{1}{\sqrt{3}}$
(d) $\frac{1}{3}-\frac{2}{\sqrt{3}}$
Q. 63. If a matrix $M$ is defined as $M=\left[\begin{array}{cc}10 & 6 \\ 6 & 10\end{array}\right]$, the sum of all the eigenvalues of $\mathrm{M}^{3}$ is equal to
$\qquad$ (in integer).
Q. 64. The first derivative of the function

$$
U(r)=4\left[\left(\frac{1}{r}\right)^{12}-\left(\frac{1}{r}\right)^{6}\right]
$$

evaluated at $r=1$ is $\qquad$ (in integer).

## CIVIL ENGINEERING (CE) P1

Q. 65. For the integral

$$
I=\int_{-1}^{1} \frac{1}{2} d x
$$

which of the following statements is TRUE?
(a) $I=0$
(b) $I=2$
(c) $I=-2$
(d) The integral does not converge
Q. 66. The following function is defined over the interval [- L, L]:

$$
F(x)=p x^{4}+q x^{5}
$$

If it is expressed as a Fourier series, which options amongst the following are true?
(a) $a_{n}, n=1,2, \ldots, \infty$ depend on $p$
(b) $a_{n}, n=1,2, \ldots, \infty$ depend on $q$
(c) $b_{n}, n=1,2, \ldots, \infty$ depend on $p$
(d) $b_{n}, n=1,2, \ldots, \infty$ depend on $q$
Q.67. The probabilities of occurrences of two independent events A and B are 0.5 and 0.8 , respectively. What is the probability of occurrence of at least A or B (rounded off to one decimal place)? $\qquad$ .
Q. 68. In the differential equation $\frac{d y}{d x}+\alpha x y=0$, is a positive constant. If $y=1.0$ at $x=0.0$, and $y=$ 0.8 at $x=1.0$, the value of $\alpha$ is (rounded off to three decimal places).
Q. 69. For the matrix

$$
[\mathrm{A}]=\left[\begin{array}{lll}
1 & 2 & 3 \\
3 & 2 & 1 \\
3 & 1 & 2
\end{array}\right]
$$

Which of the following statements is/are TRUE?
(a) The eigenvalues of $[A]^{T}$ are same as the eigenvalues of $[A]$
(b) The eigenvalues of $[A]^{-1}$ are the reciprocals of the eigenvalues of $[A]$
(c) The eigenvectors of $[A]^{T}$ are same as the eigenvectors of $[A]$
(d) The eigenvectors of $[A]^{-1}$ are same as the eigenvectors of $[A]$
Q. 70. For the function $f(x)=e^{x}|\sin x|, x \in \mathrm{R}$ which of the following statements is/are TRUE?
(a) The function is continuous at all $x$
(b) The function is differentiable at all $x$
(c) The function is periodic
(d) The function is bounded
Q. 71. The differential equation,

$$
\frac{d u}{d t}+2 t u^{2}=1,
$$

is solved by employing a backward difference scheme within the finite difference framework. The value of u at the $(n-1)^{\text {th }}$ timestep, for some $n$, is 1.75 . The corresponding time $(t)$ is 3.14 s . Each time step is 0.01 s long. Then, the value of $\left(u_{n}-u_{n-1}\right)$ is $\qquad$ . (round off to three decimal places).

## CIVIL ENGINEERING (CE) P2

Q. 72. For the matrix

$$
[\mathrm{A}]=\left[\begin{array}{ccc}
1 & -1 & 0 \\
-1 & 2 & -1 \\
0 & -1 & 1
\end{array}\right]
$$

which of the following statements is/are TRUE?
(a) $[A]\{x\}=\{b\}$ has a unique solution
(b) $[A]\{x\}=\{b\}$ does not have a unique solution
(c) $[A]$ has three linearly independent eigenvectors
(d) $[A]$ is a positive definite matrix
Q. 73. The solution of the differential equation

$$
\frac{d^{3} y}{d x^{3}}-5.5 \frac{d^{2} y}{d x^{2}}+9.5 \frac{d y}{d x}-5 y=0
$$

is expressed as $y=C_{1} e^{2.5 x}+C_{2} e^{\alpha x}, C_{3} e^{\beta x}$ where $\mathrm{C}_{1}, \mathrm{C}_{2}, \mathrm{C}_{3}, \alpha$, and $\beta$ are constants, with $\alpha$ and $\beta$ being distinct and not equal to 2.5 . Which of the following options is correct for the values of $\alpha$ and $\beta$ ?
(a) 1 and 2
(b) -1 and -2
(c) 2 and 3
(d) -2 and -3
Q. 74. Two vectors $\left[\begin{array}{llll}2 & 1 & 0 & 3\end{array}\right]^{T}$ and $\left[\begin{array}{llll}1 & 0 & 1 & 2\end{array}\right]^{T}$ belong to the null space of a $4 \times 4$ matrix of rank 2 . Which one of the following vectors also belongs to the null space?
(a) $[11-11]^{T}$
(b) $\left[\begin{array}{llll}2 & 0 & 1 & 2\end{array}\right]^{T}$
(c) $[0-21-1]^{T}$
(d) $\left[\begin{array}{llll}3 & 1 & 1 & 2\end{array}\right]^{T}$
Q. 75. Cholesky decomposition is carried out on the following square matrix [A].

$$
[\mathrm{A}]=\left[\begin{array}{cc}
8 & -5 \\
-5 & a_{22}
\end{array}\right]
$$

Let $L_{i j}$ and $A_{i j}$ be the $(i, j)^{\text {th }}$ elements of matrices $[\mathrm{L}]$ and $[\mathrm{A}]$, respectively. If the element $l_{22}$ of the decomposed lower triangular matrix [ $L$ ] is 1.968 , what is the value (rounded off to the nearest integer) of the element $a_{22}$ ?
(a) 5
(b) 7
(c) 9
(d) 11

## ENGINEERING <br> MATHEMATICS

## Solved Papers

 2023
## ANSWERS WITH EXPLANATIONS

## COMPUTER SCIENCE (CS)

1. Option (a) is correct.

Given $L_{n}=L_{n-1}+L_{n-2}$ for $n \geq 3$
Here, $L_{1}=1$ and $L_{2}=3$
Replacing $n$ by $n+2$ in equation (1),
$L_{n+2}=L_{n+1}+L_{n}$
$\Rightarrow L_{n+2}-L_{n+1}-L_{n}=0$
A.E. because $E^{2}-E-1=0$

So, $\quad E=\frac{1 \pm \sqrt{1-4 \times 1 \times-1}}{2 \times 1}=\frac{1 \pm \sqrt{5}}{2}$
$\therefore \quad$ C.F. $=C_{1}\left(E_{1}\right)^{n}+C_{2}\left(E_{2}\right)^{n}$
$=C_{1}\left(\frac{1+\sqrt{5}}{2}\right)^{n}+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)^{n}$
P. $I=0, \quad \because$ R.H.S. $=0$

Complete solution
$L_{n}=$ C.F. + P.I. $=C_{1}\left(\frac{1+\sqrt{5}}{2}\right)^{n}+C_{2}\left(\frac{1-\sqrt{5}}{n}\right)^{n}$
When $n=1, L_{1}=1=C_{1}\left(\frac{1+\sqrt{5}}{2}\right)+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)$
and $n=2 L_{2}=3=C_{1}\left(\frac{1+\sqrt{5}}{2}\right)^{2}+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)^{2}$
By solving equations (3) and (4), we get

$$
\begin{aligned}
& C_{1}\left(\frac{1+\sqrt{5}}{2}\right)^{2}+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)^{2}=3 \\
& C_{1}\left(\frac{1-\sqrt{5}}{2}\right)\left(\frac{1+\sqrt{5}}{2}\right)+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)^{2}=\frac{1-\sqrt{5}}{2} \\
& -\quad- \\
& \left(\frac{1+\sqrt{5}}{2}\right) C_{1}\left[\frac{1+\sqrt{5}}{2}-\frac{1-\sqrt{5}}{2}\right]=3-\left(\frac{1-\sqrt{5}}{2}\right)
\end{aligned}
$$

$\Rightarrow\left(\frac{1+\sqrt{5}}{2}\right) C_{1}\left[\frac{1+\sqrt{5}-1+\sqrt{5}}{2}\right]=\frac{6-1+\sqrt{5}}{2}$
$\Rightarrow\left(\frac{1+\sqrt{5}}{2}\right) \times \frac{2 \sqrt{5}}{2} C_{1}=\frac{5+\sqrt{5}}{2}$
$\Rightarrow \frac{\sqrt{5}+5}{2} C_{1}=\frac{5+\sqrt{5}}{2}$
$\Rightarrow C_{1}=1$
From (3), $\left(\frac{1+\sqrt{5}}{2}\right) \times 1+C_{2}\left(\frac{1-\sqrt{5}}{2}\right)=1$
$\Rightarrow\left(\frac{1-\sqrt{5}}{2}\right) C_{2}=1-\left(\frac{1+\sqrt{5}}{2}\right)=\frac{2-1-\sqrt{5}}{2}$
$\Rightarrow\left(\frac{1-\sqrt{5}}{2}\right) C_{2}=\frac{1-\sqrt{5}}{2} \quad C_{2}=1$
Hence, $L_{n}=\left(\frac{1+\sqrt{5}}{2}\right)^{n}+\left(\frac{1-\sqrt{5}}{2}\right)^{n}$
2. Option (a) is correct.

Given
$A=\left[\begin{array}{llll}1 & 2 & 3 & 4 \\ 4 & 1 & 2 & 3 \\ 3 & 4 & 1 & 2 \\ 2 & 3 & 4 & 1\end{array}\right], B=\left[\begin{array}{llll}3 & 4 & 1 & 2 \\ 4 & 1 & 2 & 3 \\ 1 & 2 & 3 & 4 \\ 2 & 3 & 4 & 1\end{array}\right]$
Option (a):

$$
\operatorname{det}(A)=\operatorname{det}(B)
$$

Since, interchanging the rows of a matrix, the determinant does not change
So, $\operatorname{det}(A)=-192$ and $\operatorname{det}(B)=-192$
3. Options ( $\mathbf{b} \& \mathbf{d}$ ) are correct.

Given $f(x)=x^{3}+15 x^{2}-33 x-36$ be a real valued function.
Differentiate with respect to $x$ both sides, we get

Initial coordination
$\frac{d y}{d x}=f^{\prime}(x)=3 x^{2}+30 x-33=0$
$\Rightarrow x^{2}+10 x-11=0$
$\Rightarrow(x+11)(x-1)=0$
$\Rightarrow x=1, x=-11$
$\frac{d^{2} y}{d x^{2}}=f^{\prime \prime}(x)=6 x+30$
When, we check at $x=1, \quad f^{\prime \prime}(1)=6+30=36$ $+\mathrm{ve}$
$f(x)$ has local Minima at $x=1$.
Now, we check at $x=-11$
$f^{\prime \prime}(-11)=-66+30=-36<0$
$\therefore f(x)$ has local Maxima at $x=-11$.
4. Options (a) \& (c) are correct.

Here, $f$ and $g$ be two functions of natural numbers given by
$f(x)=n$ and $g(n)=n^{2}$
$f(n) \in O(g(n)) \operatorname{TH} f(n)$ asymptotically smaller or equal to $g(n)$.
$f(n) \in O(g(n))$ TH $f(n)$ asympotically smaller than $g(n)$

$$
\begin{aligned}
& n \in O\left(n^{2}\right) \\
& n \in \Omega\left(n^{2}\right) \\
& n \in O\left(n^{2}\right) \\
& n \in \theta\left(n^{2}\right)
\end{aligned}
$$

5. Correct answer is [2].

A be the adjacency matrix of the graph with vertices $\{1,2,3,4,5\}$

Let $\lambda_{1} \lambda_{2} \lambda_{3} \lambda_{4}$ and $\lambda_{5}$ be the five five eigen values of A.
We have sum of eigen values of $A=$ Trace of $A$ $\Rightarrow \lambda_{1}+\lambda_{2}+\lambda_{3}+\lambda_{4}+\lambda_{5}=0+0+01+01+0=2$
6. Correct answer is (0).
$I=\int_{-3}^{3} \int_{-2}^{2} \int_{-1}^{1}\left(4 x^{2} y-z^{3}\right) d z d y d x$
$=\int_{-3}^{3} \int_{-2}^{2} \int_{-1}^{1} 4 x^{2} y d x d y d z-\int_{-3}^{3} \int_{-2}^{2} \int_{-1}^{1} z^{3} d x d y d z$
$=\int_{-3}^{3} \int_{-2}^{2} 4 x^{2} y[z]_{-1}^{1} d x d y-\int_{-3}^{3} \int_{-2}^{2}\left[\frac{z^{4}}{4}\right]_{-1}^{1} d x d y$
$=8 \int_{-3}^{3} \int_{-2}^{2} x^{2} y d x d y-\frac{1}{4} \int_{-3}^{3} \int_{-2}^{2}[1-1] d x d y$
$=8 \int_{-3}^{3} x^{2}\left[\frac{4^{2}}{2}\right]^{2} d x-\frac{1}{4} \times 0=8 \int_{-3}^{3} \frac{x^{2}}{2}[4-4] d x$
$=4 \int_{-3}^{3} x^{2} \times 0 d x=0 \quad$ Hence, $I=0$
7. Option (d) is correct.
given $U=\{1,2,3,4, \ldots, n\}$ where $n>1000$
$A \subseteq U, \quad B \subseteq U$ and $|A|=|B|=K$
and $A \cap B=\varnothing(k<n)$
Case I: It all element of A appear before the elements of $B$ then the number of permutations.

$$
\begin{aligned}
& ={ }^{n} C_{2 k} \cdot(n-2 k)!\cdot k!\cdot(k!) \\
& ={ }^{n} C_{2 k} \cdot(n-2 k)!(k!)^{2}
\end{aligned}
$$

Case II: If all element of $B$ appear before the elements of ' $A$ ' then number of permutations

$$
={ }^{n} C_{2 k}(n-2 k)!\cdot(k!)^{2}
$$

$\therefore$ Total number of permutations

$$
\begin{aligned}
& =\text { Case I }+ \text { Case II } \\
& =2^{n} C_{2 k}(n-2 k)!\cdot(k!)^{2}
\end{aligned}
$$

8. Options (b), (c) \& (d) are correct.

Given $f: A \rightarrow B$ be an auto (or subjective) functions.
We have $f\left(x_{1}\right)=f\left(x_{2}\right)$

$$
x_{1}=x_{2} \forall x_{1}, x_{2} \in A
$$

Every equivalence class of ' $x$ ' under $F$ is uniquely mapped with some element ' $x$ ', hence $F$ is a function and every function is well defined so option (a) is not correct.
Distinct equivalence $[x],[y]$ are having distinct images every element of co-domain ' $B$ ' is associated with same element of $\in$ under $F$ so $F$ is auto hence $F$ is bijective.
9. Options (a) \& (d) are correct.

Let $X$ be any set and $2^{X}$ is power set of $X$
$A \Delta B=(A-B) \cup(B-A)$ for $A, B \in 2^{X}$
$H=\left(2^{X}, \Delta\right)$
$H$ has satisfies the following properties
(a) $H$ satisfies Closure law under the operation ' $\Delta^{\prime}$ '
(b) H satisfies Associative law under the operation ' $\Delta^{\prime}$
(c) H satisfies Identity law under ' $\varnothing$ ' is identity.
$a \Delta \varnothing=\varnothing \Delta a=a \forall a \in Z^{X}$
(d) $H$ is satisfies Inverse law for $A \in 2^{X}$ we have Inverse of $A=A$.
(e) $H$ is satisfying commutative law

$$
\begin{aligned}
A \Delta B & =B \Delta A \text { for all } A, B \in 2^{X} \\
H & =\left(2^{X}, \Delta\right) \text { is abelian group. }
\end{aligned}
$$

10. Option (d) is correct.

Let $S$ be the sample space of tossing two coins

$$
S=\{H H, H T, T H, T T\}
$$

$P(A)=$ Probability of getting heads in both toss

$$
=\frac{2}{4}=\frac{1}{2}
$$

$P(B)=$ Probability of getting heads on first toss

$$
=\frac{2}{4}=\frac{1}{2}
$$

$P(C)=$ Probability of getting heads on second toss

$$
=\frac{2}{4}=\frac{1}{2}
$$

$$
P(A \cap B)=\frac{1}{4}=P(A) \cdot P(B)
$$

$\therefore \quad A$ and $B$ are not Independent.

$$
P(B \cap C)=\frac{1}{4}=P(B) \cdot P(C)
$$

$\therefore \quad B$ and $C$ are not independent

$$
P(A \cap C)=\frac{1}{4}=P(A) \cdot P(C)
$$

$\therefore \quad A$ and $C$ are not Independent

$$
\begin{gathered}
P\left(\frac{B}{C}\right)=P(B) \text { is True. } \\
P\left(\frac{B}{C}\right)=\frac{P(B \cap C)}{P(C)}=\frac{\frac{1}{4}}{\frac{1}{4}}=\frac{1}{2}=P(B)
\end{gathered}
$$

11. Option (b) is correct.

Let $V=\left\{V_{1} V_{2}, \ldots V_{n}\right\}$ be the set of vertices of graph $G$.
$\Delta(G)=$ Maximum degree of $G$
$N=\{11,2,3, \ldots\}$ set of all possible colours.

## Greedy strategy:

Colour $\left(V_{i}\right) \leftarrow \operatorname{Min} .\left\{j \in N\right.$ : no neighbour of $V_{i}$ is coloured j\}
By using the above strategy. no, two adjacent vertex have same colour so it is proper vertex colouring hence option (a) is True.
By using Leonard Brooke's Theorem, we chromatic number of $G$ is almost $\Delta+1$ hence option (b) is True.
12. Correct answer is [5040].
given $U=\{1,2,3\}$ graph according to description $U$ has 3 element hence if power set $2^{U}$ consist 8 elements
let $2^{U}$ denote the power set of $U$.
$2^{U}=\{\varnothing,\{1\},\{2\},\{3\}\{1,2\}\{1,3\}\{2,3\}\{1,2,3\}$
Number of BFS sequences from $\varnothing$ is $B(\varnothing)$ are $7!=5040$

## MECHANICAL ENGINEERING (ME)

13. Option (b) is correct.

We know that the graph of $y=|x|$ is

and the graph of $y=-|x|$ is

it can be observed that the given graphs can be obtained by first shifting the graph of $y=-|x|$ up by 2 units and then taking the modulus of resultant function.
Shifting up by 2 units transforms the equations to

$$
y=2-|x|
$$

and taking modulus gives the resultant eqn. as

$$
y=|2-|x||
$$

## 14. Option (d) is correct.

Given LPP is Maximize

$$
z=45 x_{1}+60 x_{2}
$$

Given constraint are

$$
\begin{align*}
& x_{1} \leq 45  \tag{A}\\
& x_{2} \leq 50  \tag{B}\\
& 10 x_{1}+10 x_{2} \geq 600  \tag{C}\\
& 25 x_{1}+5 x_{2}=750 \tag{D}
\end{align*}
$$

Step 1: Writing the given inequalities as equalities

$$
\begin{align*}
& x_{1}=45  \tag{1}\\
& x_{2}=50  \tag{2}\\
& 10 x_{1}+10 x_{2}=600  \tag{3}\\
& 25 x_{1}+5 x_{2}=750 \tag{4}
\end{align*}
$$

Step 2: Putting the above line on the graph
from (3) $10 x_{1}+10 x_{2}=600$
if $x_{1}=0 \Rightarrow x_{2}=60$
$\therefore\left(x_{1}, x_{2}\right)=(10,60)$

$$
x_{2}=0 \Rightarrow x_{1}=60
$$

$\therefore\left(x_{1}, x_{2}\right)=(60,0)$
From (4) $25 x_{1}+5 x_{2}=750$
Put $x_{1}=0 \Rightarrow x_{2}=150$

$$
\begin{aligned}
& \Rightarrow\left(x_{1}, x_{2}\right)=(0,150) \\
& x_{2}=0 \Rightarrow x_{1}=30 \\
& \Rightarrow\left(x_{1}, x_{2}\right)=(30,0)
\end{aligned}
$$

Since (c), (d) are the constraints with ' $\geq^{\prime}$ sign, shade the region above the line.

$A B C D$ is the feasible region.
Option (d) gives the feasible region.
15. Correct answer is [0].

Given vector point function

$$
B(x, y, z)=x \hat{i}+y \hat{j}-2 z \hat{k}
$$

then

$$
\int_{s} \bar{B} \cdot \hat{n} d s
$$

Relation between surface integral and volume integral

$$
\begin{aligned}
\iint_{s} \bar{F} \cdot \hat{n} d s & =\iiint_{v} \operatorname{div} \bar{F} d v \\
\int_{s} \bar{B} \cdot \hat{n} d s & =\iiint_{c} \operatorname{div} \bar{B} d v \\
\operatorname{div} \bar{B} & =\left(\frac{\partial}{\partial x} \hat{i}+\frac{\partial}{\partial y} \hat{j}+\frac{\partial}{\partial z} \hat{k}\right)(x \hat{i}+y \hat{j}+2 z \hat{k}) \\
& =1+1-2=0
\end{aligned}
$$

$$
\therefore \int_{s} \bar{B} \cdot \hat{n} d s=0
$$

## 16. Correct answer is [18.84].

Given $\hat{x}=3 y, \hat{y}=2 x$
$\therefore y=\frac{\hat{x}}{3}$ and $x=\frac{\hat{y}}{2}$
The given region

$$
\begin{gathered}
x^{2}+y^{2} \leq 1 \\
\text { or } \quad\left(\frac{\hat{y}}{2}\right)^{2}+\left(\frac{\hat{x}}{3}\right)^{2} \leq 1
\end{gathered}
$$

$$
\frac{\hat{y}^{2}}{4}+\frac{\hat{x}^{2}}{9} \leq 1
$$

This is equation of an ellipse with semi major axis $a=3$ and semi minor axis $b=2$
Then area of transformation region is
$\mathrm{A}=\pi \mathrm{ab}=\pi \times 3 \times 2=6 \pi=18.84$ units

## 17. Correct answer is [2].

Given

$$
\begin{equation*}
f(z)=e^{-k x}(\cos 2 y-i \sin 2 y) \text { is the } \tag{1}
\end{equation*}
$$

Where function of a complex variable.

$$
z=x+i y
$$

We have

$$
\begin{equation*}
\omega=f(z)=u+i v \tag{2}
\end{equation*}
$$

Then

$$
\begin{aligned}
& u(x \cdot y)=e^{-k x} \cos 2 y \\
& v(x \cdot y)=-e^{-k x} \sin 2 y
\end{aligned}
$$

Given function is analytic if its satisfy cauchyRiemann equation.

$$
\begin{align*}
& \frac{\partial u}{\partial x}=\frac{\partial v}{\partial y} \text { and } \frac{\partial u}{\partial y}=\frac{\partial v}{\partial x} \\
& \frac{\partial u}{\partial x}=-k e^{-k x} \cos 2 y  \tag{3}\\
& \frac{\partial u}{\partial y}=2 e^{-k x} \sin 2 y  \tag{4}\\
& \frac{\partial v}{\partial x}=k e^{-k x} \sin 2 y  \tag{5}\\
& \frac{\partial v}{\partial y}=-2 e^{-k x} \cos 2 y \tag{6}
\end{align*}
$$

Since $f(z)$ is analytic

$$
\begin{gathered}
\frac{\partial u}{\partial x}=\frac{\partial v}{\partial y} \\
\Rightarrow-k e^{-k x} \cos 2 y=-2 e^{-k x} \cos 2 y
\end{gathered}
$$

Hence, $k=2$
18. Option (a) is correct.

Given

$$
\begin{aligned}
& f(s)=\frac{1}{s^{3}-s}=\frac{1}{s\left(s^{2}-1\right)} \\
& f(s)=\frac{1}{s(s-1)(s+1)}
\end{aligned}
$$

We have by Partial Fraction Method
$\frac{1}{s(s-1)(s+1)}=\frac{A}{s}+\frac{B}{s-1}+\frac{C}{s+1}$
$1=A(s-1)(s+1)+B(s+1) s+C(s)(s-1)$
Put $s=1$ both sides
$1=2 B \quad \therefore \quad B=\frac{1}{2}$ again put $s=-1$
$1=2 C \quad \therefore \quad C=\frac{1}{2}$ again put $s=0$
$1=A(-1) \quad \therefore \quad A=-1$
$\frac{1}{s(s-1)(s+1)}=\frac{-1}{s}+\frac{1}{2(s-1)}+\frac{1}{2(s+1)}$
Taking $L^{-1}$ both sides
$L^{-1}\{f(s)\}=$

$$
-L^{-1}\left\{\frac{1}{s}\right\}+\frac{1}{2} L^{-1}\left\{\frac{1}{s-1}\right\}+\frac{1}{2} L^{-1}\left\{\frac{1}{s+1}\right\}
$$

$f(t)=-1+\frac{1}{2} e^{t}+\frac{1}{2} e^{-t}$

## 19. Correct answer is [8]

Let $x$ and $y$ be length and breadth of the rectangle
Given

$$
\begin{equation*}
\text { Area } x \times y=4 \tag{1}
\end{equation*}
$$

Let perimeter minimum $B=2(x+y)$
From (1)

$$
\begin{array}{rlrl}
\mathrm{B} & =2\left(x+\frac{4}{x}\right) \text { is minimum } \\
& \text { or } \quad \frac{d B}{d x} & =2\left(1+\left(\frac{4}{x^{2}}\right)\right)=0 \\
\Rightarrow 2-\frac{8}{x^{2}} & =0 \\
\Rightarrow 2 & =\frac{8}{x^{2}} \\
& \therefore \quad x^{2} & =\frac{8}{2}=4 \\
& \therefore \quad x & = \pm 2 \\
& \therefore \quad x & =2(+\mathrm{ve}) \\
& y & =2
\end{array}
$$

Then the smallest perimeter is

$$
B=2(x+y)=2(2+2)=8 \text { units }
$$

## 20. Correct answer is [9].

Given second order Differential equation.
$x^{2} \frac{d y^{2}}{d x^{2}}+x \frac{d y}{d x}-y=0, x \geq 1$
with initial condition $y(1)=6, y^{\prime}(1)=2$
Find $y$ at $x=2$.
Which is Homogeneous Linear Deferential Equation of higher order with variable coefficients.

| $x=e^{z}$ | $z=\log x$ | $D^{\prime}=\frac{d}{d z}$ |
| :--- | :--- | :--- |

Put $x \frac{d y}{d x}=D^{\prime}(y)$

$$
x^{2} \frac{d^{2} y}{d x^{2}}=D^{\prime}\left(D^{\prime}-1\right) y
$$

$\Rightarrow D^{\prime}\left(D^{\prime}-1\right) y+D^{\prime} y-y=0$
$\Rightarrow\left(D^{\prime 2}-D^{\prime}+D^{\prime}-1\right) y=0$
$\Rightarrow f\left(D^{\prime}\right)=0, \quad D^{\prime}=m$
$\Rightarrow m^{2}-1=0 \quad \therefore m= \pm 1$, Real and distinct.
C.F. $=C_{1} \dot{e}^{z}+C_{2} \bar{e}^{z}$ P. Z. $=0$
$\because$ R.H.S. $=0$
Complete solutions $y=$ C.F. + P.Z.
$y=C_{1} e^{z}+C_{2} e^{-z} \quad$ Put $Z=\log x$
$y=C_{1} x+\frac{C_{2}}{x}$
Apply initial condition
$y(1)=6, \quad \therefore \quad 6=C_{1}+C_{2}$
$\frac{d y}{d x}=C_{1}+C_{2}\left(\frac{-1}{x^{2}}\right)$
$y^{\prime}(1)=2 \quad 2=C_{1}-C_{2}$
From (2) and (3)
$\mathrm{C}_{1}+\mathrm{C}_{2}=6$
$\frac{C_{1}-C_{2}=2}{2 C_{1}=8 \Rightarrow} C_{1}=4$
or $C_{2}=6-4=2$
$\therefore \quad C_{2}=2$
Hence $y=4 x+\frac{2}{x}$
Put $x=2 \quad y=8+\frac{2}{2}=8+1=9$
Since, $y=9$ at $x=2$
21. Correct answer is [1].

Given initial value problem,

$$
\frac{d y}{d t}+2 y=0, \quad y(0)=0, \quad t_{0}=0, \quad y_{0}=0
$$

We have by Euler's method

$$
\begin{equation*}
y_{n+1}=y_{n}+h f\left(x_{n}, y_{n}\right) \tag{1}
\end{equation*}
$$

$\frac{d y}{d t}=-2 y=f(t, y), \quad h=\Delta t=$ Positive.

$$
\begin{aligned}
& \therefore \quad y_{n+1}=y_{n}+\Delta t \times f\left(t_{n}, y_{n}\right) \\
& \Rightarrow y_{n+1}=y_{n}+\Delta t \times\left(-2 y_{n}\right) y_{n}(1-2 \Delta t) \\
& \Rightarrow \frac{y_{n+1}}{y_{n}}=1-2 \Delta t \\
& \Rightarrow\left|\frac{y_{n+1}}{y_{n}}\right| \leq 1 \Rightarrow|1-2 \Delta t| \leq 1 \\
& \Rightarrow \quad-1 \leq 1-2 \Delta t \leq 1 \\
& \Rightarrow \quad 0 \leq 2 \Delta t \leq 2 \\
& \Rightarrow \quad 0 \leq \Delta t \leq 1
\end{aligned}
$$

## ELECTRICAL ENGINEERING (EE)

22. Option (d) is correct.

We have normal vector to the surface $\varnothing(x, y, z)$ is $\vec{N}$
$\bar{N}=\operatorname{grad} \varnothing=\bar{\nabla} \varnothing$
Given a vector $W=[1,2,3]^{T}$
Plane defined by $W^{T} X=1$
Let $X=\left[\begin{array}{l}x \\ y \\ z\end{array}\right]$
$W^{T} X=1 \Rightarrow\left[\begin{array}{lll}1, & 2 & 3\end{array}\right]\left[\begin{array}{l}x \\ y \\ z\end{array}\right]=1$
$\therefore \quad x+2 y+3 z=1$
$\varnothing=x+2 y+3 z-1=0$
$\frac{\partial \varnothing}{\partial x}=1, \quad \frac{\partial \varnothing}{\partial y}=2 \quad \frac{\partial \varnothing}{\partial z}=3$
$\bar{N}=\operatorname{grad} \varnothing \bar{\nabla} \varnothing=\frac{\partial \varnothing}{\partial x} \hat{i}+\frac{\partial \varnothing}{\partial y} \hat{j}+\frac{\partial \varnothing}{\partial z} \hat{k}$

$$
=\hat{i}+2 \hat{j}+3 \hat{k}
$$

$\therefore$ Normal vector to the surface
$\bar{N}=\hat{i}+2 \hat{j}+3 \hat{k}=[1,2,3]^{T}$
23. Option (b) is correct.

Given $x(t)$

$x(w)=1$ for $|w|<w_{0}$

$$
\begin{aligned}
& =0 \text { for }|w|>w_{0} \\
& \therefore \quad y(t)=\frac{\sin w_{0} t}{\pi t} \\
& \text { At } t=\frac{\pi}{2 w_{0}} \Rightarrow x\left(\frac{\pi}{2 w_{0}}\right)=\frac{\sin \pi / 2}{\pi \times \frac{\pi}{2 w_{0}}} \\
& =\frac{2 w_{0}}{\pi^{2}}
\end{aligned}
$$

$\therefore$ Option (c) and (d) are wrong.
If $w_{0} \rightarrow \infty$ then

if $X(w)=\mathrm{DC}-$ signal $=1$
$\therefore \quad X(t)=\delta(t)$
So option (B) is correct.
Now $X[0]=\frac{\text { Area of } X(w)}{2 \pi}=\frac{2 w_{0}}{2 \pi}=\frac{w_{0}}{\pi}$
$\therefore X(0)$ will increase if $w_{0}$ increase
So option (a) is wrong.
24. Option (b) is correct.

Given
$\mathrm{X}(\mathrm{z})=\frac{4 z}{\left(\frac{z-1}{5}\right)\left(\frac{z-2}{3}\right)(z-3)}$ with $\mathrm{ROC}=R$

$\frac{2}{3}<z<3$
If ROC is $\frac{2}{3}<z<3$ then it is including $z=1$ circle or unit circle so, DTFT will convergence.
25. Option (a) is correct.

Then vectors $u$ and $v$ are related as
$A u=v$
$\left[\begin{array}{ll}a_{11} & a_{12} \\ a_{21} & a_{22}\end{array}\right]\left[\begin{array}{l}4 \\ 3\end{array}\right]=\left[\begin{array}{l}5 \\ 0\end{array}\right]$
$4 a_{11}+3 a_{12}=5$
$4 a_{21}+3 a_{22}=0$
$A=\left[\begin{array}{cc}\frac{4}{5} & \frac{3}{5} \\ -\frac{3}{5} & \frac{4}{5}\end{array}\right]$ satisfy the above two equations.
Now, $4 \times \frac{4}{5}+3 \times \frac{3}{5}=5$
And $\frac{4 \times(-3)}{5}+\frac{4 \times 3}{5}=0$

## 26. Correct answer is [1.93].

Given

| $X$ | -1 | 0 | 1 |
| :---: | :---: | :---: | :---: |
| $Y$ | 0.8 | 2.2 | 2.8 |

Let $y=a+b x$
be the equation of one degree curve (straight line)
We have the normal euation of one degree curve,
No. of data $n=3$
$\Sigma y=n a+b \Sigma x$

| $X$ | $Y$ | $X^{2}$ | $X Y$ |
| :---: | :---: | :---: | :---: |
| -1 | 0.8 | 1 | -0.8 |
| 0 | 2.2 | 0 | 0 |
| 1 | 2.8 | 1 | 2.8 |
| $\Sigma X=0$ | $\Sigma Y=5.8$ | $\Sigma X^{2}=2$ | $\Sigma X Y=2.0$ |

Then $5.8=3 a+b \times 0$
$a=\frac{5.8}{3}=1.93$
$2=a \times 0+b \times 2$
$(\therefore b=1)$
$\therefore$ Equation of curve,
$Y=a+b x=1.93+x$

## 27. Options (a), (b) \& (d) are correct.

Given space $\left|x_{1}\right| P+\left|x_{2}\right|^{P}=1$ for $P>0$
(a) For $P=2$

Eqn. $\left|x_{1}\right|^{2}+\left|x_{2}\right|^{2}=1$ is a unit circle.
Area $=\pi(1)^{2}=\pi \quad$ it is True.
(b) For $P=1$

Equation $\left|x_{1}\right|+\left|x_{2}\right|=1$ is square.
Area $=\frac{d z}{Z}=\frac{2^{2}}{2}=2$

## 28. Correct answer is [2].

Given
$A=\left[\begin{array}{rr}0 & 1 \\ -1 & -2\end{array}\right] \quad B=\left[\begin{array}{l}0 \\ 1\end{array}\right] \quad C=[3,-2] \quad D=1$
The transfer function
$T F=C[S I-A]^{-1} B+D$
$[S I-A]^{-1}=\left[\begin{array}{cc}S & -1 \\ 1 & S+2\end{array}\right]^{-1}$

$$
=\frac{1}{\left(S^{2}+2 S+1\right)}\left[\begin{array}{cc}
S+2 & 1 \\
-1 & S
\end{array}\right]
$$

$T F=\frac{1}{\left(S^{2}+2 S+1\right)}[3,-2]\left[\begin{array}{cc}s+2 & 1 \\ -1 & s\end{array}\right]\left[\begin{array}{l}0 \\ 1\end{array}\right]+1$
$=\frac{3-2 S}{S^{2}+2 S+1}+1=\frac{S^{2}+4}{S^{2}+2 S+1}$
$H(J w)=\frac{4-\omega^{2}}{1-\omega^{2}+2 J \omega}$
The output will be zero, for $\omega^{2}-4=0$ $\Rightarrow \omega=2 \mathrm{Rad} / \mathrm{sec}$.
29. Correct answer is [0.038].

Given $\mathbf{x}(n) \rightleftarrows X\left(e^{i \Omega}\right)=(1+\cos \Omega) e^{-j \Omega}$
and $X_{p}(n)=$ Periodic signal $\rightleftarrows a_{k}=$ DFScoefficient with $N=5$

$$
\text { Where } \begin{aligned}
X_{P}(n) & =\left\{\begin{array}{cl}
X(n) & \text { for } n=0,1,2 \\
0 & \text { for } n=3,4
\end{array}\right. \\
a_{k} & =\frac{X\left(e^{i K \Omega_{0}}\right)}{N}, \text { where } \Omega_{0}=\frac{2 \pi}{N}=\frac{2 \pi}{5} \\
& =\frac{1}{5}\left(1+\cos K \Omega_{0}\right) \cdot e^{-j K \Omega_{0}} \\
& =\frac{1}{5}\left[1+\cos \frac{2 \pi}{5} K\right] e^{-j \frac{2 \pi}{5} K}
\end{aligned}
$$

Put

$$
\begin{aligned}
K=3\left|a_{3}\right| & =\frac{1}{5}\left[1+\cos \frac{6 \pi}{5}\right] \\
& =\frac{1}{5}(1-0.809)=0.038
\end{aligned}
$$

## 30. Correct answer is [9.42].

given $r=1+\cos \theta \quad r=\sqrt{x^{2}+y^{2}} \quad \bar{F}=-y \hat{i}+x \hat{j}$

$C: r=1+\cos \theta$
$\oint_{C} \bar{F} \cdot d \bar{r}=\oint_{C}-4 d x+x d y$
By Green's Theorem
Relation beween line integral and surface integral

$$
\begin{aligned}
& \int p d x+Q d y=\iint_{R}\left(\frac{\partial N}{\partial x}-\frac{\partial M}{\partial y}\right) d x d y \\
& \begin{aligned}
\int_{C}-y d x & +x d y=\iint_{R} 2 d x d y \\
& =2 \text { Area of region bounded by C } \\
& =2 \times \frac{1}{2} \int_{\theta=0}^{2 \pi} r^{2} d \theta=\int_{0}^{2 \pi}(1+\cos \theta)^{2} d \theta \\
& =\int_{0}^{2 \pi}\left(1+\cos ^{2} \theta+2 \cos \theta\right) d \theta \\
& =[\theta]_{0}^{2 \pi}+4 \int_{0}^{\pi / 2} \cos ^{2} \theta d \theta+4 \int_{0}^{\pi} \cos \theta d \theta \\
& =2 \pi+4 \times \frac{1}{2} \times \frac{\pi}{2}+0=2 \pi+\pi=3 \pi \\
& =3 \times 3.14=9.42
\end{aligned}
\end{aligned}
$$

## 31. Correct answer is [10].

Let

$$
\begin{aligned}
f\left(x_{1}, x_{2}\right) & =x_{1}^{2}+2 x_{2}^{2}+3 x_{1}+3 x_{2}+x_{1} x_{2}+1 \\
& =\bar{\nabla} f=\frac{\partial f}{\partial x_{1}} \hat{i}+\frac{\partial f}{\partial x_{2}} \hat{j} \\
& =\left(2 x_{1}+3+x_{2}\right) \hat{i}+\left(4 x_{2}+3+x_{1}\right) \hat{j} \\
(\bar{\nabla} f) & =6 \hat{i}+8 \hat{j} \\
|\bar{\nabla} f| & =\sqrt{6^{2}+8^{2}}=\sqrt{36+64}=\sqrt{100}=10
\end{aligned}
$$

Now $\quad\left|a_{k}\right|=\frac{1}{5}\left[1+\cos \frac{2 \pi}{5} K\right]$

## ELECTRONICS COMMUNICATION (EC)

## 32. Option (c) is correct.

given
$V_{1}=\left[\begin{array}{l}1 \\ 2 \\ 0\end{array}\right] \quad V_{2}=\left[\begin{array}{l}2 \\ 1 \\ 3\end{array}\right]$ be two vectors
$V_{1}=\alpha V_{2}+e$
$\therefore \quad e=V_{1}-\alpha V_{2}$ $e=\left[\begin{array}{lll}1 & 2 & 0\end{array}\right]-\alpha\left[\begin{array}{lll}2, & 1, & 3\end{array}\right]$
$=(\hat{i}+2 \hat{j}+0 \hat{k})-\alpha(2 \hat{i}+\hat{j}+3 \hat{k})$
$=(1-2 \alpha) \hat{i}+(2-\alpha) \hat{j}-3 \alpha \hat{k}$

$$
\hat{e}=\sqrt{(1-2 \alpha)^{2}+(2-\alpha)^{2}+(-3 \alpha)^{2}}
$$

$$
A=|e|^{2}=(1-2 \alpha)^{2}+(2-\alpha)^{2}+9 \alpha^{2}
$$

$=1+4 \alpha^{2}-4 \alpha+4+\alpha^{2}-4 \alpha+9 \alpha^{2}$
$=5+14 \alpha^{2}-8 \alpha$ is minimum
If $\quad \frac{\partial e^{2}}{\partial \alpha}=\frac{\partial A}{\partial \alpha}=28 \alpha-8=0$
$\therefore \quad \alpha=\frac{8}{28}=\frac{2}{7}$

$$
\alpha=\frac{2}{7}
$$

33. Option (b) is correct.

Given $f(x, y, z)=x y z$ be any scalar point functions. We have the directional derivative of $f$ in the direction of the vector $\bar{v}=2 \hat{i}+\hat{j}+2 \hat{k}$ at the point $P(0,2,1)$.

$$
\begin{align*}
\frac{d f}{d s} & =\operatorname{grad} f \cdot \hat{a}=\operatorname{grad} f \cdot \hat{v}  \tag{1}\\
\operatorname{grad} f & =\vec{\nabla} \cdot f=\frac{\partial f}{\partial x} \hat{i}+\frac{\partial f}{\partial y} \hat{j}+\frac{\partial f}{\partial z} \hat{k} \\
& =y z \hat{i}+z x \hat{j}+x y \hat{k} \\
\vec{v} & =2 \hat{i}+\hat{j}+2 \hat{k}
\end{align*}
$$

at $P(0,2,1)(\operatorname{grad} f)_{\text {at } p}=2 \hat{i}$

$$
\begin{align*}
\frac{d f}{d s} & =\operatorname{grad} f \cdot \hat{v}=2 \hat{i} \times \frac{(2 \hat{i}+\hat{j}+2 \hat{k})}{\sqrt{4+1+4}}=\frac{4}{\sqrt{9}}  \tag{1}\\
\text { or } \frac{d f}{d s} & =\frac{4}{3}
\end{align*}
$$

## 34. Option (a) is correct.

given $\quad \omega^{4}=16 j$

$$
\begin{aligned}
\omega & =(16 j)^{\frac{1}{4}}=\left(2^{4} \cdot j\right)^{\frac{1}{4}}=2(j)^{\frac{1}{4}} \\
\omega & =2(0+j)^{\frac{1}{4}}=2\left[e^{j(2 n+1) \pi / 2}\right]^{\frac{1}{4}} \\
& =2\left[e^{j(2 n+1) \pi / 8}\right]
\end{aligned}
$$

For $n=0, \quad \omega=2 e^{j \pi / 8}$
For $n=2, \quad \omega=2 e^{5 \pi j / 8}=2 e^{5 \pi j / 8}$
For $n=4, \quad \omega=2 e^{9 \pi / / 8}$

## 35. Option (b) is correct.

Given contour integral
$\oint_{C}\left(\frac{z+2}{z^{2}+2 z+z}\right) d z$, where $C$ is

$$
\left\{z:\left|z+1-\frac{3}{2} i\right|=1\right\}
$$

Taken in the counter clockwise direction.
Pole: equating denominator to zero
$z^{2}+2 z+2=0 \quad \therefore z^{2}+2 z+1+1=0$
$(\mathrm{z}+1)^{2}+1=0 \quad \therefore(z+1)^{2}=-1$
$\therefore z+1= \pm \sqrt{-1}= \pm i$
$\therefore z=-1 \pm i$
$\mathrm{z}=-1+i,-1-i$, There are two poles.
C: $\left|z+1-\frac{3}{2}\right|=1 ; \sqrt{(x+1)^{2}+\left(y-\frac{3}{2}\right)^{2}}=1$,
$\Rightarrow(x+1)^{2}+\left(y-\frac{3}{2}\right)^{2}=1$
is a circle of Radius 1 and centre $(-1,3 / 2)$ only he pole $z=-1+i$ lie inside the circle.
We have by Cauchy's Residue Theorem

$$
\begin{aligned}
\oint_{C} f(z) d z & =2 \pi j \operatorname{Res}[f(z)]_{z=-1+i} \\
& =2 \pi j\left(\frac{z+2}{2(z+1)}\right)_{z=-1+j}
\end{aligned}
$$

$$
=2 \pi j\left(\frac{-1+j+2}{2(-1+j+1)}\right)=\pi(1+j)
$$

36. Option (c) is correct.

We have diagonalization of a Matrix.

$$
\begin{equation*}
D=P^{-1} A P \tag{1}
\end{equation*}
$$

where $D$ is the diagonal Matrix, whose diagonal elements are the eigen values of $A$.

$$
B=P^{-1} \mathrm{AP} \Rightarrow A=P B P^{-1}
$$

$\Rightarrow A$ and $B$ are called similar Matrices.
$\Rightarrow$ Both A, B have same set eigen values but eigen vectors of $A, B$ are different.
Let $B X=\lambda X \quad \Rightarrow \quad\left(P^{-1} \mathrm{AP}\right) X=\lambda X$

$$
\begin{aligned}
\left(P^{-1} \mathrm{AP}\right) X & =\lambda X \\
\Rightarrow A(P X) & =\lambda(P X)
\end{aligned}
$$

$\therefore \quad$ Eigen vectors of $A$ are $P X$.
37. Option (c) is correct.

We have by Fourier transform

$$
F\{f(x)\}=\frac{1}{\sqrt{2 \pi}} \int_{-\infty}^{\infty} e^{i s x} f(x) d x=f(s)
$$

we know $e^{-a t^{2}} ; a>0 \stackrel{F T}{\rightleftarrows} \sqrt{\frac{\pi}{a}} e^{-\omega^{2} / 4 a}$
Here; $a=1$

$$
\therefore \quad X(\omega)=\sqrt{\pi} e^{-\omega^{2} / 4}
$$

38. Option (b) is correct.

We have

$$
\begin{aligned}
\text { L.I. } & =\int_{C} \vec{F} \cdot d r, \quad d \bar{r}=d x \hat{i}+d y \hat{j}+d z \hat{k} \\
\text { Given L.I. } & =\int_{P}^{Q}\left(z^{2} d x+3 y^{2} d y+2 x z d z\right) \\
& =\int_{P}^{Q} 3 y^{2} d y+\int_{P}^{Q} d\left(x z^{2}\right) \\
& =\int_{P}^{Q} 3 y^{2} d y+\left[x z^{2}\right]_{(1,1,2)}^{(2,3,1)} \\
\text { L.I. } & =\left[\frac{3 y^{3}}{3}\right]_{1}^{3}+[2-4] \\
=27-1-2 & =27-3=24
\end{aligned}
$$

39. Option (a) is correct.
$X=\left[\begin{array}{c}x_{1} \\ x_{2} \\ \vdots \\ x_{n}\end{array}\right]_{n \times 1}, l=\sqrt{x^{T} x}$
The trace of the matrix $P=x x^{\mathrm{T}}$

$$
\text { Given } \begin{aligned}
& l=\sqrt{x^{T} x}, P=\left(x x^{T}\right)_{m \times n} \\
& l=\sqrt{x^{T} \cdot x}=\sqrt{x_{1}^{2}+x_{2}^{2}+x_{3}^{2}+\cdots x_{4}^{2}} \\
& P=x x^{T}=\left[\begin{array}{c}
x_{1} \\
x_{2} \\
\vdots \\
x_{n}
\end{array}\right] \\
&=x_{1}^{2}+x_{2}^{2}+\cdots+x_{n}^{2} \\
&=\left[\begin{array}{cccc}
x_{1}^{2} & x_{2} & - & x_{n}
\end{array}\right] \\
& \vdots x_{2}^{2} \\
& \vdots \\
& \vdots \\
& \vdots \ddots \\
& \\
&=x_{1}^{2}+x_{2}^{2}+\cdots+x_{n}^{2}=l^{2}
\end{aligned}
$$

## 40. Correct answer is [0].

$I=\iint_{R} x y d x d y$ over the Region

$I=\iint_{R_{1}} x y d x d y+\iint_{R_{2}} x y d x d y$
$I=\int_{0}^{1} \int_{-y}^{y} x y d x d y+\int_{1}^{2} \int_{y-2}^{2-y} x y d x d y$
$\because \int_{-a}^{0} f(x) d x=0$. If $f(x)$ is an odd function.
$I=0+0=0$

## 41. Correct answer is [15].

given $x_{1}(t)=u(t+1.5)-u(t-1.5)$
$\Rightarrow \quad x_{1}(t)=\operatorname{rect}(t / 3)$

$$
x_{1}(t)=\operatorname{rect}(t / 3) \xrightarrow{F T} 3 S a(1.5 w)
$$

Now $x_{2}(t)=\delta(t+3)+\operatorname{rect}(t / 2)+2 \delta(t-2)$
We have by Fourier Transform

$$
\begin{aligned}
x_{2}(w) & =e^{3 j w}+2 s a(w)+2 e^{-2 j w} \\
y(t) & =x_{1}(t) \cdot x_{2}(t)
\end{aligned}
$$

We know $y(w)=\int_{-\infty}^{\infty} y(t) e^{-j w t} d t$

$$
\begin{aligned}
& \therefore \quad \int_{-\infty}^{\infty} y(t)=y(0) \\
& \therefore \quad y(0)=x_{1}(0) \cdot x_{2}(0)=3[1+2+2]=15
\end{aligned}
$$

## INSTRUMENTATION ENGINEERING (IN)

42. Option (a) is correct.
$x-2 y+z=0, x+0 y-z=0$ solving
$\frac{x}{(-2)(-1)-0}=\frac{y}{(1)(0)-(-1)(1)}$ $=\frac{z}{1(0)-(-2)(1)}=\propto$
$\Rightarrow \quad \frac{x}{2-0}=\frac{y}{1+1}=\frac{z}{0+2}=\propto$
$\Rightarrow \frac{x}{2}=\frac{y}{2}=\frac{z}{2}=\propto$
or $\frac{x}{1} \cdot \frac{y}{1}=\frac{z}{1}=\propto$
$\Rightarrow \quad x=\propto, y=\propto, z=\infty$
$\therefore\left[\begin{array}{l}x \\ y \\ z\end{array}\right]=\left[\begin{array}{l}\propto \\ \propto \\ \propto\end{array}\right]=\propto\left[\begin{array}{l}1 \\ 1 \\ 1\end{array}\right]$, when $\propto \in R$
$\mathrm{S}=\left[\propto\left[\begin{array}{l}1 \\ 1 \\ 1\end{array}\right], \propto \in R\right]$
43. Option (b) is correct.

$$
\begin{aligned}
F(Z) & =\frac{1}{1-Z}=\frac{-1}{Z-1} \\
& =-\left[\frac{1}{Z-2+1}\right]=-\left[\frac{1}{1+(Z-2)}\right]
\end{aligned}
$$

$\therefore$ Region of convergence is $|Z-2|<1$
$=-[1+(Z-2)]^{-1}\left[\because(1+x)^{-1}=1-x+x^{2}-x^{3}\right]$
$=-\left[1-(Z-2)+(Z-2)^{2}-(Z-3)^{3}+\ldots\right]$
$=-\left[\sum_{K=0}^{\infty}(-1)^{K}(Z-2)^{K}\right]$ for $|Z-2|<1$
$=\sum_{K=0}^{\infty}(-1)^{K+1}(Z-2)^{K}$ which is of the form
$\sum_{K=0}^{\infty} a_{k}(Z-2)^{K}$, where $a_{k}=(-1)^{K+1}$
44. Option (c) is correct.

The given equation can be written as
$\frac{d^{2} x}{d t^{2}}=-K \frac{d x}{d t} \Rightarrow \frac{d^{2} x}{d t^{2}}+K \frac{d x}{d t}=0$
Operator form is $\left(D^{2}+K D\right) x=0$
Auxillary equation $f(m)=0, m^{2}+k m=0$
$\Rightarrow \quad m(m+k)=0$
$\Rightarrow \quad m=0,-k$ are the roots.
$\therefore x=C_{1} e^{0(t)}+C_{2} e^{-k t} \Rightarrow x=C_{1}+C_{2} e^{-k t} \ldots$
Given Initial Conditions are
$x(0)=1 \quad$ i.e., when $t=0, x=1$

From (A) $x^{\prime}=0+C_{2} \cdot e^{-k t} \cdot(-k)$
$\Rightarrow \quad x^{\prime}=-C_{2} k e^{-k t}$
Using (1) in (A) we get $C_{1}+C_{2}=1$
Using (2) in (B) we get $0=-C_{2} k \cdot e^{0} \Rightarrow C_{2}=0$ $\therefore C_{1}=1$

Substituting $C_{1}$ and $C_{2}$ values in $A$, we get $x=1$ or $x(t)=1$

## 45. Option (c) is correct.

Let $u(t)$ be the unit step function. We know that by the definition of unit step function

$X(t)=A \sin (p t+q)$ and $Y(t)=A^{\prime} \sin (\pi t+\varnothing)$
Here $A^{\prime}=A \cdot|U(w)|_{w=w_{0}}, \quad \varnothing=Q+$ Angle
$\left.u(\omega)\right|_{\omega=\omega_{0}}$
we have $\omega_{0}=\pi, \mathrm{A}^{\prime}=1, \phi=0$
By using the unit step function formula:

$$
\begin{aligned}
|u(\omega)|_{\omega=p} & =\frac{\sqrt{\omega^{2}+\pi^{2}}}{\sqrt{\omega^{2}+\pi^{2}}}=1 \\
\frac{u(\omega)}{\omega^{2} \pi} & =180-\tan ^{-1}\left(\frac{\omega}{\pi}\right)-\tan ^{-1}\left(\frac{\omega}{\pi}\right) \\
& =180-90=90 \\
\therefore \quad A=1 & \Rightarrow \theta=-90^{\circ}
\end{aligned}
$$

Now $x(t)=\sin \left(\pi t-90^{\circ}\right)=\sin \left[\pi t-\frac{\pi}{2}\right]$
$\therefore \quad x(t)=\sin \left[\pi t-\frac{\pi}{2}\right] u(t)$
46. Option (b) is correct.

$$
\begin{aligned}
\operatorname{Ltt}_{x \rightarrow \infty} f(x) & =\underset{x \rightarrow \infty}{\operatorname{Lt}} x \sin \frac{1}{x}=\underset{\frac{1}{x} \rightarrow 0}{\operatorname{Lt}} x \sin \frac{1}{x} \\
& =\underset{\frac{1}{x} \rightarrow 0}{\operatorname{Lt}} \frac{\sin 1 / x}{1 / x}=1 \quad\left[\because \operatorname{Lt}_{x \rightarrow 0} \frac{\sin x}{x}=1\right]
\end{aligned}
$$

## 47. Correct answer is [2]

$$
P(S)=S^{3}+2 S^{2}+5 S+80
$$

The roots are $-4.64,1.32,1.32$
$\therefore$ Number of zeros of $P(S)$ in the right half plane is 2

## 48. Correct answer is [25]

$y(t)=x(4 t) \quad \mathrm{T}=100 \sec \quad x(t)=\sin \left(\omega_{0} t\right)$
we know

$$
\begin{aligned}
\omega_{0} & =\frac{2 \pi}{T}=\frac{2 \pi}{100} \mathrm{rad} / \mathrm{sec} \\
\therefore \quad y(t) & =x(4 t)=\sin \left(4 \omega_{0} t\right)=\sin \left[4\left(\frac{2 \pi}{100}\right) t\right] \\
& =\sin \left[\frac{8 \pi}{100} t\right] \\
\therefore \quad \frac{2 p}{T} & =\frac{8 p}{100} \Rightarrow \frac{1}{T^{1}}=\frac{1}{25} \Rightarrow T^{1}=25 \mathrm{sec}
\end{aligned}
$$

## 49. Correct answer is [ -0.5 ].

From the given data probability distribution is

| $X$ | 0 | 1 | 2 |
| :---: | :---: | :---: | :---: |
| $P(X)$ | 0.25 | 0.5 | $k$ |

we know that for discrete random variable $\Sigma P_{i}=1$
$\Rightarrow \quad 0.25+0.5+k=1$
$\Rightarrow \quad k=0.25$
$\therefore P(X=0)=0.25, \mathrm{P}(x=1)=0.5, \mathrm{P}(x=2)=0.25$
$E(X)=\Sigma x_{i} P_{i}=0(0.25)+1(0.5)+2(0.25)$

$$
=1
$$

$$
E\left(X^{2}\right)=\Sigma x_{i}^{2} P_{i}=0^{2}(0.25)+1^{2}(0.5)+2^{2}(0.25)
$$

$$
=1.5
$$

$\therefore \quad E(X)-\mathrm{E}\left(X^{2}\right)=1-1.5=-0.5$
50. Option (c) is correct.
$x(t)=e^{-3 t} u(t-5) \Rightarrow L[x(t)]=\left[L e^{-3 t} u(t-5)\right]$
From second shifting theorem we have
If $L[f(t)]=F(s)$ and $g(t)=\left[\begin{array}{cc}f(t-a) & t>a \\ 0 & t<0\end{array}\right]$
then $L[g(t)]=e^{-a s} F(s)$
where $u(t-5)$ is unit step function
$\therefore L[u(t-5)]=\left.\frac{1}{S} e^{-5 s}\right|_{S \rightarrow S+3}$
By using first shifting theorem
$=\frac{1}{S+3} e^{-5(S+3)}=\frac{e^{-5(S+3)}}{S+3}, \operatorname{Real}\{S\}>-3$

## 51. Option (a) is correct.

Let
$f(z)=\frac{i(1-z)}{1+z}$, where $z$ is a complex number,
$i=\sqrt{-1}$
Let

$$
\begin{aligned}
\omega=u+i v & =u+\frac{i(1-z)}{1+z} \\
& =\frac{i[1-(x+i y)]}{1+(z+i y)}=\frac{i-i x+y}{(1+x)+i y} \\
& =\frac{i(1-x)+y}{(1+z)+i y} \times \frac{i(1+x)-i y}{(1+z)-i y} \\
& =\frac{[i(1-x)+y][(1+x)-i y]}{(1+x)^{2}+y^{2}} \\
& =\frac{i\left(1-x^{2}-y^{2}\right)+(1-x) y+y(1+x)}{(1+x)^{2}+y^{2}} \\
& =\frac{2 y+i\left(1-x^{2}-y^{2}\right)}{(1+x)^{2}+y^{2}} \\
& =\frac{2 y}{(1+x)^{2}+y^{2}}+\frac{i\left(1-x^{2}-y^{2}\right)}{(1+x)^{2}+y^{2}}
\end{aligned}
$$

To find the image of real axis in w-plane, $V=0$

Then $\frac{1-x^{2}-y^{2}}{(1+x)^{2}+y^{2}}=0 \Rightarrow 1-x^{2}-y^{2}=0$
$\Rightarrow x^{2}+y^{2}=1$
$\therefore f^{-1}(z)$ maps the real axis in w-maps into a unit circle in z-plane.

## 52 .Correct answer is [240].

Given 5 digits out of which 2 are identical.
Number of ways $=\frac{5!}{2!}=\frac{120}{2}=60$
Out of four digits exactly one digits appearing twice.
Number of ways $={ }^{4} C_{1}=4$
Total number of ways for five digit number $=4 \times 60$

$$
=240
$$

## 53. Correct answer is [1].

The sample measurement are $80 \mathrm{~kg}, 79 \mathrm{~kg}, 81 \mathrm{~kg}$, 79 kg and 81 kg
No. of Samples $n=5$

$$
\begin{aligned}
\bar{X} & =\frac{\text { Sum of observations }}{\text { No. of observations }} \\
& =\frac{80+7981+79+81}{5}=80
\end{aligned}
$$

Sample standard deviation $=$
$\sigma=\sqrt{\frac{\sum\left(x_{i}-\bar{x}\right)^{2}}{n-1}}$

$$
\begin{aligned}
& =\sqrt{\frac{(80-80)^{2}+(79-80)^{2}+(81-80)^{2}+(79-80)^{2}+(81-80)^{2}}{5-1}} \\
& =\sqrt{\frac{4}{4}}=1 \\
& \therefore \text { S.D. }=\sigma=1 \mathrm{~kg}
\end{aligned}
$$

54. Correct answer is [1].
$g(x)=\max \left\{(x-2)^{2},-2 x+7\right\}$, where $x \in(-\infty, \infty)$
$g(x)=\max \left\{(x-2)^{2},-2 x+7\right\}$ graph

From the figure
Minimum value of $g(x)$ is at $x=3$
$\Rightarrow g(3)=(3-2)^{2}$ or $[-2(3)+7]$

$$
=1
$$

$\therefore$ The minimum value of $g(x)$ is 1 .

## 55. Correct answer is [-8].

The matrix $\mathrm{A}=\left[\begin{array}{cc}1 & 4 \\ -3 & \alpha \\ \beta & 6\end{array}\right],(A)=1$
Minor of order $2=0$
$\because P(A)=1$
$\left|\begin{array}{cc}1 & 4 \\ -3 & \alpha\end{array}\right|=0 \Rightarrow \alpha+12=0 \quad \Rightarrow \alpha=-12$
and also
$\left[\begin{array}{cc}-3 & \alpha \\ \beta & 6\end{array}\right]=0 \Rightarrow-18-\alpha \beta=0 \quad \Rightarrow \alpha \beta=-18$
$\beta=\frac{-18}{12}=\frac{3}{2}$
or
$\left[\begin{array}{ll}1 & 4 \\ \beta & 6\end{array}\right]=0 \Rightarrow 6-4 \beta=0 \quad \Rightarrow 6=4 \beta$
$\beta=\frac{3}{2}$
$\therefore \frac{\alpha}{\beta}=\frac{-12}{3 / 2}=-8$

## CHEMICAL ENGINEERING (CH)

56. Option (b) is correct.

As $x \rightarrow 0$ we get $\frac{0}{0}$ (undefined form)
By L Hospital Rule $\left[L t \frac{f}{g}=L t \frac{f^{\prime}}{g^{\prime}}\right]$

$$
\begin{aligned}
y & =\operatorname{Lt}_{x \rightarrow 0} \frac{2 x}{e^{x}-1}=\operatorname{Lt}_{x \rightarrow 0} \frac{2}{e^{x}-0} \\
& =\operatorname{Lt}_{x \rightarrow 0} \frac{2}{e^{x}}=\frac{2}{e^{0}}=2
\end{aligned}
$$

57. Option (d) is correct.

Given that $\bar{v}=z x \bar{i}+2 x y \bar{j}+3 y z \bar{k}$
We have if $\bar{v}=V_{1} \bar{i}+V_{2} \bar{j}+V_{3} \bar{k}$
$\operatorname{div} \bar{v}=\frac{\partial V_{1}}{\partial x}+\frac{\partial V_{2}}{\partial y}+\frac{\partial V_{3}}{\partial z}$
$y=\frac{\partial}{\partial x}(z x)+\frac{\partial}{\partial y}(2 x y)+\frac{\partial}{\partial z}(s y z)=z+2 x+3 y$
$\operatorname{div} \bar{v}$ at the point $(3,2,1)=1+2(3)+3(2)$

$$
=13
$$

58. Option (b) is correct.

$$
\begin{aligned}
F & =\frac{\left|z_{1}+z_{2}\right|}{\left|z_{1}\right|+\left|z_{2}\right|} \\
& =\frac{|(2+3 i)+(-2+3 i)|}{|2+3 i|+|-2+3 i|} \\
& =\frac{|0+6 i|}{\sqrt{2^{2}+3^{2}}+\sqrt{(-2)^{2}+3^{2}}} \\
& =\frac{\sqrt{(0)^{2}+6^{2}}}{\sqrt{4+9}+\sqrt{4+9}}=\frac{\sqrt{36}}{\sqrt{13} \sqrt{13}} \\
& =\frac{6}{13}=0.4615<1 \\
\mathrm{~F} & <1
\end{aligned}
$$

## 59. Option (d) is correct.

Given $\hat{e}_{r}=\cos \theta \hat{i}+\sin \theta \hat{j}, \hat{e}_{\theta}=-\sin \theta \hat{i}+\cos \theta \hat{j}$

$$
\begin{aligned}
\hat{e}_{r}+\hat{e}_{\theta}= & (\cos \theta \hat{i}+\sin \theta \hat{j})+(-\sin \theta \hat{i}+\cos \theta \hat{j}) \\
= & (\cos \theta-\sin \theta) \hat{i}+(\sin \theta+\cos \theta) \hat{j} \\
\frac{\partial}{\partial \theta}\left(\hat{e}_{r}+\hat{e}_{\theta}\right) & =(-\sin \theta-\cos \theta) \hat{i}+(\cos \theta-\sin \theta) \hat{j} \\
& =-\sin \theta \hat{i}-\cos \theta \hat{i}+\cos \theta \hat{j}-\sin \theta \hat{j} \\
& =(-\sin \theta \hat{i}+\cos \theta \hat{j})-(\cos \theta \hat{i}+\sin \theta \hat{j}) \\
& =\hat{e}_{\theta}-\hat{e}_{r} \\
& =-\hat{e}_{r}+\hat{e}_{\theta}
\end{aligned}
$$

## 60. Correct answer is [-1].

Given that $\frac{d^{2} x}{d t^{2}}=-\omega^{2} x \Rightarrow \frac{d^{2} x}{d t^{2}}+\omega^{2} x=0$
In operator form $\left(D^{2}+w^{2}\right) \mathbf{x}=0$
Auxiliary equation is
$f(m)=0 \Rightarrow m^{2}+\omega^{2}=0 \Rightarrow m= \pm \omega i$
$\therefore x(t)=C_{1} \cos \omega t+C_{2} \sin \omega t$
The initial conditions are

$$
\begin{align*}
& x(t=0)=1 \text { when } t=0, x=1  \tag{1}\\
& \left.\frac{d x}{d t}\right|_{t=0} \text { i.e., } t=0, x^{\prime}=0
\end{align*}
$$

From (A)

$$
\begin{equation*}
x=C_{1} \cos \omega t+C_{2} \sin \omega t \tag{B}
\end{equation*}
$$

$\Rightarrow \quad x^{\prime}=-C_{1} \omega \sin \omega t+C_{2} \omega \cos \omega t$
Using (1) in (A) $t=0, x=1 \Rightarrow C_{1}=1$
$\operatorname{Using}(2)$ in (B) $0=-C_{1}(0)+C_{2} \omega(1) \Rightarrow C_{2}=0$
From (A)

$$
\begin{array}{rlrl}
x & =\cos \omega t & {\left[\because \cos x \pi=(-1)^{n}\right]} \\
\text { At } t= & \frac{3 \pi}{\omega} & \\
x & =\cos \omega\left(\frac{3 \pi}{\omega}\right) & \\
& =\cos 3 \pi & & {\left[\because \cos n \pi=(-1)^{n}\right]} \\
x & =-1 &
\end{array}
$$

## 61. Option (b) is correct.

Probability $=\frac{\text { Area of rectangle } A}{\text { Area of square }}$
Based on the data given in the problem, we will get the rectangle and square shape.

Area of rectangle $=|x-y| \leq 20$

$$
\text { Probability }=\frac{40 \sqrt{2} \times 20 \sqrt{2}}{60 \times 60}=\frac{4}{9}
$$

62. Option (b) is correct.

Given $I=\int_{-1}^{1} \sqrt{1-x^{2}} d x$ with length of the interval is 0.5 i.e., $\lambda=0.5 ; n=\frac{b-a}{h}=\frac{2}{0.5}=4$

By Sampson's 1/3rd Rule
$y=\frac{h}{3}[($ sum of first and last ordinates $)+4($ sum of odd) +2 (sum of even)]

| $x$ | -1 | -0.5 | 0 | 0.5 | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $I=f(x)=\sqrt{1-x^{2}}$ | 0 | 0.8660 | 1 | 0.8660 | 0 |

$$
\begin{aligned}
& I=\frac{h}{3}\left[\left(y_{0}+y_{4}\right)+4\left(y_{1}+y_{3}\right)+2 y_{2}\right] \\
&=\frac{0.5}{3}[(0+0)+4(0.8660+0.8660)+2(1)] \\
&=\frac{0.5}{3}(8.928)=1.488 \\
& \text { i.e., } \frac{1}{3}+\frac{2}{\sqrt{3}}
\end{aligned}
$$

## 63. Correct answer is [41160].

Given that

$$
\begin{aligned}
\mathrm{M} & =\left[\begin{array}{cc}
10 & 6 \\
6 & 10
\end{array}\right] \\
|M-\lambda I| & =\left|\begin{array}{cc}
10-\lambda & 6 \\
6 & 10-\lambda
\end{array}\right| \\
& =(10-\lambda)^{2}-36=0
\end{aligned}
$$

Expanding we get

$$
\begin{array}{rlrl} 
& & \lambda^{2}-20 \lambda+64 & =0 \\
\Rightarrow & \lambda^{2}-16 \lambda-4 \lambda+64 & =0 \\
\Rightarrow & \lambda(\lambda-16)-4(\lambda-16) & =0 \\
& \lambda & =4,16
\end{array}
$$

$\therefore$ Eigen values of M are 4,16
Eigen values of $\mathrm{M}^{3}$ are $4^{3}, 16^{3}$
Sum of $\mathrm{M}^{3}$ Eigen values $=4^{3}+16^{3}=41160$
64. Correct answer is [-24].

Given that
$u(r)=4\left[\left(\frac{1}{r}\right)^{12}-\left(\frac{1}{r}\right)^{6}\right]=4\left[r^{-12}-r^{-6}\right]$
$u^{1}(r)=4\left[-12 r^{-13}-(-6) r^{-7}\right] \quad\left[\because d\left(x^{n}\right)=n x^{n-1}\right]$
At $\mathrm{r}=1$

$$
\begin{aligned}
u^{1}(1) & =4\left[-12(1)^{-13}+6(1)^{-7}\right] \\
& =4[-12+6]=4[-6]=-24
\end{aligned}
$$

## CIVIL ENGINEERING (CE) P1

65. Option (d) is correct.

The integral lies in between -1 to +1 . But at $x=0$
$f(x)=\frac{1}{x^{2}}$ does not exist. Because $\frac{1}{0}=\infty$ which is not defined.
$\therefore$ The integral does not converge.
66. Options (b) \& (c) are correct.

Given $F(x)=p x^{4}+q x^{5}$ on (-L, L)
The fourier series expansion is given by
$f(x)=a_{0}+\sum_{n=1}^{\infty} a_{n} \sin \left(\frac{\pi x}{L}\right)+\sum_{n=1}^{\infty} b_{n} \cos \left(\frac{\pi x}{L}\right)$
where
$a_{0}=\frac{1}{L} \int_{-L}^{L} f(x) d x$
$a_{n}=\frac{1}{L} \int_{-L}^{L} f(x) \sin \left(\frac{n \pi x}{L}\right) d x$
$b_{n}=\frac{1}{L} \int_{-L}^{L} f(x) \cos \left(\frac{n \pi x}{L}\right) d x$
Consider

$$
\begin{aligned}
a_{n}= & \frac{1}{L} \int_{-L}^{L} f(x) \sin \left(\frac{n \pi x}{L}\right) d x \\
= & \frac{1}{L} \int_{-L}^{L}\left(P x^{4}+q x^{5}\right) \sin \left(\frac{n \pi x}{L}\right) d x \\
= & \left\{\frac{1}{L} \int_{-L}^{L} P x^{4} \sin \left(\frac{n \pi x}{L}\right) d x+\right. \\
& \left.\frac{1}{L} \int_{-L}^{L} q x^{5} \sin \left(\frac{n \pi x}{L}\right) d x\right\}
\end{aligned}
$$

$$
=\frac{1}{L}\left\{0+q \int_{-L}^{L} x^{5} \sin \left(\frac{n \pi x}{L}\right) d x\right\}, \text { Since I integral }
$$

is an odd function.

$$
=\frac{1}{L}\left\{2 \int_{0}^{L} q x^{5} \sin \left(\frac{n \pi x}{L}\right) d x\right\}
$$

i.e. an depends on $q$

$$
\begin{aligned}
b_{n} & =\frac{1}{L} \int_{-L}^{L} f(x) \cos \left(\frac{n \pi x}{L}\right) d x \\
& =\frac{1}{L}\left\{\int_{-L}^{L} P x^{4} \cos \left(\frac{n \pi x}{L}\right) d x+\right.
\end{aligned}
$$

$$
\left.\int_{-L}^{L} q x^{5} \cos \left(\frac{n \pi x}{L}\right) d x\right\}
$$

$$
=\frac{1}{L}\left[2 \int_{0}^{L} P x^{4} \cos \left(\frac{n \pi x}{L}\right) d x\right] \text {, since II integral }
$$ is an even function.

i.e. $b_{n}$ depends on p .

## 67. Correct answer is [0.9].

Given $A, B$ are independent events $P(A)=0.5$, $P(B)=0.8$
$P(A \cup B)=P(A)+P(B)-P(A \cap B)$
Since $\mathrm{A} \& \mathrm{~B}$ are independent events.

$$
\begin{aligned}
P(A \cap B) & =P(A) \cdot P(B) \\
P(A \cup B) & =0.5+0.8-(0.5)(0.8) \\
& =1.3-0.4=0.9
\end{aligned}
$$

## 68. Correct answer is [0.446].

Given differential equation $\frac{d y}{d x}+\alpha x y=0$
$\frac{d y}{d x}=-\alpha x y \Rightarrow \frac{d y}{y}=-\alpha x d x$. Integrating on both sides, we get

$$
\begin{align*}
& \int \frac{d y}{y}=-\alpha \int x d x \Rightarrow \log y=-\alpha \frac{x^{2}}{2}+\log c \\
& \Rightarrow \log \frac{y}{c}=-\alpha \frac{x^{2}}{2} \\
& \Rightarrow \frac{y}{c}=e^{-\alpha \frac{x^{2}}{2}} \Rightarrow y=c e^{-\alpha \frac{x^{2}}{2}} \tag{A}
\end{align*}
$$

The given conditions are $y=1$ at $x=0$
$y=0.8$ at $x=1$
Substituting (1) in A, we get $c=1$
Putthevalueof(2)inA $\Rightarrow 0.8=c e^{-\frac{\alpha}{2}} \Rightarrow e^{-\frac{\alpha}{2}}=0.8$
$\Rightarrow e^{\frac{\alpha}{2}}=\frac{1}{0.8} \Rightarrow \frac{\alpha}{2}=\log \left(\frac{1}{0.8}\right) \Rightarrow \frac{\alpha}{2}=0.22314$
$\Rightarrow \alpha=0.44628 \cong 0.446$
69. Options (a, b, c, d) are correct.

$$
\begin{aligned}
\mathrm{A} & =\left[\begin{array}{lll}
1 & 2 & 3 \\
3 & 2 & 1 \\
3 & 1 & 2
\end{array}\right] \\
\Rightarrow|A-\lambda I| & =\left[\begin{array}{ccc}
1-\lambda & 2 & 3 \\
3 & 2-\lambda & 1 \\
3 & 1 & 2-\lambda
\end{array}\right]
\end{aligned}
$$

Expanding we get 6, 1,-2
From the properties of Eigen values satisfies
(i) Eigen values of $A^{T}$ and $A$ are same.
(ii) Eigen vectors of $A$ and $A^{T}$ are same
(iii) Eigen values of $\mathrm{A}^{-1}$ is reciprocal of Eigen values of A.
(iv) Eigen vectors of $\mathrm{A}^{-1}$ are same as the eigen vectors of $A$.
So answer is a, b, c, d
70. Option (a) is correct.
$f(x)=e^{x}|\sin x|$ given function is continuous at all $x$. But it is not bounded and not differentiable and not periodic.
The graph is

71. Correct answer is [ -0.1823 ].

Given D.E. is $\frac{d u}{d t}+2 t u^{2}=1$
$\frac{d u}{d t}=1-2 t u^{2}=f(t, u)$
where $f(t, u)=1-2 t u^{2}$
From Eulers iterative formula

$$
u_{n}=u_{n-1}+h f\left(t_{n}, u_{n}\right)
$$

Given that $h=0.01, u_{n}=1.75, t_{n}=3.14$

$$
\begin{aligned}
u_{n}-u_{n-1} & =h\left[1-2 t_{n} u_{n}^{2}\right] \\
& =0.01\left[1-2(3.14)(1.75)^{2}\right] \\
& =-0.1823
\end{aligned}
$$

## CIVIL ENGINEERING (CE) P2

72. Options (b, c) are correct.

Given that

$$
\begin{aligned}
A= & {\left[\begin{array}{ccc}
1 & -1 & 0 \\
-1 & 2 & -1 \\
0 & -1 & 1
\end{array}\right] \sim\left[\begin{array}{ccc}
1 & -1 & 0 \\
0 & 1 & -1 \\
0 & -1 & 1
\end{array}\right] \sim\left[\begin{array}{ccc}
1 & -1 & 0 \\
0 & 1 & -1 \\
0 & 0 & 0
\end{array}\right] } \\
& R_{2} \rightarrow R_{2}+R_{1} \quad R_{3} \rightarrow R_{3}+R_{2}
\end{aligned}
$$

which is the Echelon form rank of $A=2$ but $n=3$ (no of unknown)
If $r<n$, No. of Lineraly independent solutions $=n-r=3-2=1$
$\therefore[A][x]$ has infinite solutions.

$$
|A-\lambda I|=\left|\begin{array}{ccc}
1-\lambda & -1 & 0 \\
-1 & 2-\lambda & -1 \\
0 & -1 & 1-\lambda
\end{array}\right|=0
$$

By expanding we get $(1-\lambda)\left(\lambda^{2}-3 \lambda+1-\lambda\right)=0$ $\Rightarrow(1-\lambda) \lambda(\lambda-3)=0 \Rightarrow \lambda=0,1,3$
$\therefore$ Eigen values of A are $0,1,3$
It has 3 linearly independent eigen vectors and is positive semi definite.
73. Option (a) is correct.

Given that
$\frac{d^{3} y}{d x^{3}}-5.5 \frac{d^{2} y}{d x^{2}}+9.5 \frac{d y}{d x}-5 y=0$
Operator form is $m^{3}-5.5 m^{2}+9.5 m-5=0$
$\therefore m=2.5,1,2$
$\therefore y=C_{1} e^{2.5 x}+C_{2} e^{x}+C_{3} e^{2 x}$
$\therefore \alpha=1, \beta=2$
74. Option (a) is correct.

Given that rank of $A_{4 \times 4}=2$ i.e. $P(A)=2, n=4$
By using Rank and Nullity theorem
Rank of $\mathrm{A}+$ Nullity of $\mathrm{A}=$ number of columns in A.
$\Rightarrow$ Nullity of $A=4-2=2 \Rightarrow N(A)=2$
$\therefore N(A)$ consists only 2 linearly independent vectors.
The given vectors are $x=\left[\begin{array}{l}2 \\ 1 \\ 0 \\ 3\end{array}\right], y=\left[\begin{array}{l}1 \\ 0 \\ 1 \\ 2\end{array}\right]$

These are linearly independents, remaining are Lineraly dependent

$$
\therefore x-y=\left[\begin{array}{l}
2 \\
1 \\
0 \\
3
\end{array}\right]-\left[\begin{array}{l}
1 \\
0 \\
1 \\
2
\end{array}\right]=\left[\begin{array}{c}
1 \\
1 \\
-1 \\
1
\end{array}\right]
$$

75. Option (b) is correct.

$$
l_{21}^{2}+l_{22}^{2}=a_{22}
$$

Given that $A=\left[\begin{array}{cc}8 & -5 \\ -5 & a_{22}\end{array}\right]$
We know that $L L^{T}=A$
$\left[\begin{array}{ll}l_{11} & 0 \\ l_{21} & l_{22}\end{array}\right]\left[\begin{array}{cc}l_{11} & l_{21} \\ 0 & l_{22}\end{array}\right]=\left[\begin{array}{cc}8 & -5 \\ -5 & a_{22}\end{array}\right]$
$\Rightarrow\left[\begin{array}{cc}l_{11}^{2}+0 & l_{11} l_{21}+0 \\ l_{21} l_{11}+0 & l_{21}^{2}+l_{22}^{2}\end{array}\right]=\left[\begin{array}{cc}8 & -5 \\ -5 & a_{22}\end{array}\right]$

$$
\begin{aligned}
& \Rightarrow\left[\begin{array}{cc}
l_{11}^{2} & l_{11} l_{21} \\
l_{21} l_{11} & l_{21}^{2}+l_{22}^{2}
\end{array}\right]=\left[\begin{array}{cc}
8 & -5 \\
-5 & a_{22}
\end{array}\right] \\
& \Rightarrow l_{11}^{2}=8 \Rightarrow l_{11}=\sqrt{8} ; \\
& l_{11} l_{21}=-5 \Rightarrow l_{21}=\frac{-5}{\sqrt{8}}
\end{aligned}
$$

Given that $l_{22}=1.968$

$$
\begin{aligned}
& \therefore\left(\frac{-5}{\sqrt{8}}\right)^{2}+(1.968)^{2}=a_{22} \\
& \Rightarrow a_{22}=6.998 \simeq 7
\end{aligned}
$$
