MGM brake motors are asynchronous threephase totally enclosed fan cooled motors (TEFC). The motor brakes in case of power supply failure. The braking action is always obtained through a very quick and precise stop and it guarantees a safe and prompt intervention in case of power failure.
The braking action is obtained without shaft axial sliding and it provides equal braking torque in both directions of rotation. MGM brake motors are particularly suitable for hoist and traverse machines, tooling machinery, automatic and transfer machinery in textile, ceramic and packing fields and in all those situations where precision and quick-
ness in braking are required. MGM brake motors are designed and assembled as real brake motors. The perfect engineering and assembling combined with a strong and safe brake, make these motors very reliable.
As standard, on the IM B3 mounting (foot mounted), feet are integrated in the frame (they are not attached to the frame) making the motor very sturdy. This feature is very important on those brake motor applications where the stress during start/stop is very high.
The brake disc lining material is asbestos free with high friction coefficient and very long lasting. The motors are provided with
the IP 54 enclosure rating and insulation class F. On request they can be provided with the IP 55 or IP 56 enclosure ratings and with insulation class H. All MGM motors are designed for inverter duty. On request it is possible to supply the motor with an encoder fitted on the shaft's non drive end (NDE), or to have the shaft predisposed for encoder fitting. For further information please refer to the encoder series section. MGM brake motors series are: BA and BM.

## BA series

The BA series consists of three phase, asynchronous brake motors totally enclosed fan cooled (TEFC). The BA series range starts from 71 up to 315 frame size. As standard, the brake power supply is AC 3-phase. On request DC brake can be provided with a rectifier integrated in the terminal box. The rectifier is provided with an over-voltage protection device. All BA series motors are provided with manual brake release. The BA series cooling fan is fitted between the motor and the braking assembly. The brake moving element and the brake coil have a laminated magnetic nucleus to reduce losses and to allow very fast brake.
BA series main features are a very quick braking action, both in realeasing and braking operation, a high brake torque, a constant braking time and a very high number of start/stop cycles also under severe applications.

## BM series

The BM series consists of three phase, asynchronous brake motors totally enclosed fan cooled (TEFC). The BM series range starts from 56 up to 225 frame size. As standard the brake power supply is DC 1-phase with a rectifier integrated in the terminal box. The rectifier is provided with an over-voltage protection device. The cooling fan is fitted at non-drive shaft end.
BM series main features are a low braking noise, a gradual acceleration during the motor start and stop and reduced overall dimensions.

The BA and BM series are also available in the following main versions:
X (BAX, BMX) for continuous duty and IE2 / IE3 efficiency class ( regulation EU 2019/1781). Alternatively the BA, BM series can be made in the 'Enhanced Power' version for intermittent duty only.
H (BAH) with brake assembly enclosure with higher IP protection degree.
PV (BAPV, BMPV): with flywheel that allow progressive start and stop, particularly suitable for traverse application.
F (BAF): with double brake disc and extremely high brake torque.
AV-SV with forced cooling (BMAV with axial forced cooling, BASV with double radial forced cooling).
BM (BMBM) with double brake particularly suitable to be used in TV-cine studios and theatres stages.
E (BAE, BME) with built-in encoder.
K (BAPK, BAK) with K brake disc for hoisting applications.

The table below shows the production range. For single speed motors, starting from 0.12 kW , only those in $\mathrm{BAX}, \mathrm{BAHX}, \mathrm{BMX}$ version for continuous duty and efficiency class compliant with European regulation EU 2019/1781 are listed. Further powers are available for the BA and BM series motors in the 'Enhanced Power' version for intermittent duty only (see page 52).

[^0]
## motor designation

The following technical characteristics are used to correctly identify MGM motors:

| Series | $B A X, B M X, \ldots$ (1) | example: BAX |
| :---: | :---: | :---: |
| Frame size | $56-315 \mathrm{~mm}$ | example: 71 |
| Power and poles | $\left[\begin{array}{llll} 0.04 & -132 \mathrm{~kW} \\ & & & \\ 2 & 4 & 6 & 8 \end{array} 2 / 4 \quad 4 / 8 \quad 2 / 6\right.$ | example: $\mathbf{0 . 3 7} \mathbf{~ k W} 4$ Pole or B 4 (see technical data) |
| Efficiency class | IE2 -IE3 | example: IE2 |
| Mounting | see mounting section | example: IM B5 |
| Voltage and frequency | according to customer request | example: $\mathbf{2 3 0 / 4 0 0 V} \mathbf{5 0} \mathbf{~ H z}$ |
| Brake supply | - AC or DC 3 <br> - single or double terminal board box (4) | example: AC brake coil double terminal board box for separate brake supply |
| Insulation class | F or H | example: class F |
| Enclosure | IP54, IP55, IP56 | example: IP 54 |

It is necessary to indicate any special features or options not supplied as standard (see page 67), such as reduced diameter flanges, thermal protectors, tropical environment execution, etc. Unless otherwise specified, the brake supply voltage is the same as the motor voltage. Unless otherwise specified, the DC brake voltage supply is $230 \mathrm{~V} 50 / 60 \mathrm{~Hz}$.

The BMX and BAX series are also available in BMXPV and BAXPV version with soft start and stop suitable for traversing, and the version (BMX)SV, (BAX)SV with forced cooling fan. The BAX series is also available in the BAXF version, with double brake disc and premium brake torque.

## 2

In two speed motors, the model number is followed by the letter D on motors with Dahlander winding, and by the letters DA on motors incorporating two separate windings (i.e. BADA 71 B 2/8).

## 3

BA series motors are available with both DC and AC brakes while BM series motors are available with DC brakes only. Brake Motors equipped with a $D C$ brake and a power supply higher than 24 V are supplied with a suitable rectifier located inside the terminal box.

## 4

Single speed motors can be provided with a single terminal box with the motor and brake power terminals connected in parallel, or with a double terminal board, having the supply separated from the motor. Unless otherwise specified, single speed motors up to 90 frame size are provided with just one terminal board. Motors with frame size 100 and above are provided as standard feature with a double terminal board box. On two speed motors, the motor power supply is always separate from the brake power supply. On single speed motors with separate brake power supply a double terminal board box has to be provided. A double terminal board box also has to be provided on motors with the following options or auxiliary devices: thermo protectors (PTO), thermistors (PTC), anti-condensation heaters, forced cooling, IP 56-65-66 enclosure, EMI filters, DC brake with brake power supply higher than 254V, brake voltage different from motor voltage, motor voltage 40050 Hz DELTA connection, encoder, microswitch, terminal box on side.

[^1]standards and approvals

| Descripition | IEC | cevele |
| :---: | :---: | :---: |
| Ratings and performance | IEC 60034-1 | EN 60034-1 |
| Efficiency classes | IEC 60034-30-1 | EN 60034-30-1 |
| Standard test methods for determining losses and efficiency | IEC 60034-2-1 | EN 60034-2-1 |

| Noise limits | IEC 60034-9 | EN 60034-9 |

MGM brake motors have the $\mathbf{C} \in$ mark on the nameplate to indicate the conformity to the requirements of the Union harmonization legislations 2014/35/EU "Low Voltage Directive" and 2014/30/EU "Electromagnetic Compatibility".

UKCA marking
MGM motors can be provided with uk marking. The UKCA marking is a product marking that is used for motors being placed on the market in Great Britain.

## UL and CSA standards

On request MGM motors can be provided with cCSAus approval in conformity with the requirements of the standards UL 1004-1 "Electric motors" and CSA C 22.2 No. 100 "Motors and generators" for the North American market. The approved motors show the © © ${ }_{\text {© }}$. mark on the nameplate. For more info please see the related paragraph (Motors for Usa and Canada, page 74).

BIS certification
MGM motors can be provided, on request, with BIS certification (standard IS 12615:2018) that is the compulsory certification in India. Certified motors show the mark on the nameplate. For more info please see the related paragraph (India, page 77).

CCC declaration
On request MGM motors can be provided with CCC (China Compulsory Certification) declaration for the Chinese market. The approved motors show the © mark on the nameplate. For more info please see the related paragraph (China, page 78).

EAC declaration
On request MGM motors can be provided with EAC declaration for the Eurasian Custom Union countries (Russia, Belarus, Kazakhstan). For more info please please see the related paragraph (Page 79).

Every motor is provided with an identifying nameplate, on which specific motor information is given. Motor nameplates are shown below with motor data and explanatory notes. The nameplate shown on the left is used for single speed motors while the nameplate on the right is used for two speed motors. A QR code is on the nameplate of each motor through which you can link to a specific page and access various documents including the use and maintenance manual, electrical connections diagrams and technical data sheets relating to the specific series of motors.

## Duty type

Protection degree
Insulation Class, the letters TR following the insulation class indicate tropicalized treatment
Weight (Kg)
Motor type Designation
Serial number
Maximum Static Brake Torque obtainable with proper regulation of the springs (Nm)
Brake current (A)
Brake Voltage Supply (V). On brake motors with AC brake, the symbol "Vb = Vm" indicates that the motor and brake have the same voltage supply. For the motor with DC brake the indication 1~230V or 1~400V represent the AC side single phase input voltage to the rectifier (230V or 400V)
Rated Power (kW) at 50 Hz
Power Factor at 50 Hz
Motor Speed (RPM) at 50 Hz
Motor Voltage Supply at 50 Hz , Delta connected
Motor Amps at 50 Hz , Delta connected
Motor Voltage Supply at 50 Hz , Star connected
Motor Amps at 50 Hz , Star connected
Rated Power (kW) at 60 Hz
Power Factor at 60 Hz
Motor Speed (RPM) at 60 Hz
Motor Voltage Supply at 60 Hz , Delta connected
Motor Amps at 60 Hz , Delta connected
Motor Voltage Supply at 60 Hz , Star connected
Motor Amps at 60 Hz , Star connected
Motor voltage supply at 50 Hz
Motor Amps at 50 Hz
Motor voltage supply at 60 Hz
Motor Amps at 60 Hz
Mounting
For motors with forced cooling fans, the fan voltage supply is shown in this location, preceded by the letters "VENT". The letters "TP" indicate the presence of bimetallic thermal protectors, "TM" indicate thermistors, and "SCALD" indicates anti-condensation heaters, all followed by the voltage supply
Efficiency and efficiency class at 50 Hz
Efficiency and efficiency class at 60Hz
Certification marks (©< ${ }_{\text {ss }}$, © , etc.)
If the letters "DM" appear in this location, it means that the motor is supplied with a double terminal board box for a separate brake feeding Motor phases number ( $3=$ three phase; $1=$ single phase )
Note: on motor nameplates with special execution additional information or information placed in different fields can be present.

The table below, describes the electromechanical tolerances concerning electric motors, according to the EN 60034-1 standard.

The table below describes the mechanical tolerances in accordance with the IEC 72 standard.

| Characteristic | Tolerance |  |
| :--- | :---: | :--- |
| Shaft height | $-0,5 \mathrm{~mm}$ |  |
| Flange spigot | $j 6$ | for motors with shaft heights $\leq 160 \mathrm{~mm}$ |
|  | h 6 | for motors with shaft heights $>180 \mathrm{~mm}$ |
| Shaft end diameter | j 6 | $\varnothing$ from 9 mm up to 28 mm |
|  | k 6 | $\varnothing$ from 38 mm up to 48 mm |
|  | mb | $\varnothing$ from 55 mm up to 75 mm |

Standard and special flanges
The table below shows the dimensions of the standard flanges and of the special ones available along with the shaft dimensions. NEMA flanges and shafts are available on request.

[^2]
## type of construction and mounting

Horizontal shaft mountings

Vertical shaft mountings

| IM V1 | IM 3011 | IM V15 | IM 2011 |
| :--- | :--- | :--- | :--- |

for information about the classifications of other types of construction and mounting please contact MGM.

The enclosure rating of the motor has to be suitable for the environment conditions the motor operates in. According to the IEC34-5 (EN 60034-5) standard the designation of the protection degree is expressed by means of a symbol made up of two letters (IP) followed by a two digit number. The first digit indicates the protection degree provided by the motor enclosure in contact with parts in motion, electrically energized, or against the penetration of foreign bodies. The second digit indicates the protection degree of the motor enclosure against damages caused by the liquid infiltration.

> IP First digit Second digit
First digit
$\mathbf{0}$ No protection.
$\mathbf{1}$ The machine is protected against the penetration of solid bodies
greater than 50 mm in diameter (for example, protection against the
accidental touch of a hand).

2 The machine is protected against the penetration of solidbodies greater than 12 mm in diameter.

3 The machine is protected against the penetration of solid bodies greater than 2.5 mm in diameter.
4 The machine is protected against the penetration of solid bodies greater than 1 mm in diameter.
5 The machine is protected against the penetration of dust. The penetration is not completely avoided, but should not compromise the good functioning of the machine.
6 Dust tight machine.

## Second digit

0 No protection.
1 Vertical dropping of water on the machine will not result in damaging effects.

2 Vertical dropping of water on the machine will not result in damaging effects when the machine is not inclined more than $15^{\circ}$ from its normal position.
3 Water or rain dropping on the machine at an angle up to $60^{\circ}$ will not result in damaging effects.
4 Water spraying on the machine from any angle will not result in damaging effects to the machine.
5 Water jets on the machine from any angle will not result in damaging effects to the machine.

6 Waves of water will not result in damaging effects to the machine.
7 Immersing the machine in water under specific conditions of pressure and time will not cause the ingress of a damaging quantity of water.
8 Immersing the machine permanently in water under conditions of pressure and time given by the manufacturer will not result in damaging effects.

MGM brake motors come with standard IP54 enclosure rating.
For use in standard industrial environments IP54 is sufficient. For outdoor applications or for application that involve contact with water, protection degree IP55 or IP56 is advisable; it's however recommended to adopt appropriate additional protections.
During installation check the proper tightening of the cable gland and, if possible, provide the cable entry with curving from bottom up. For outdoor vertical mounting with shaft down a rain roof (for BM series) and a special brake cover (for BA series) are available on request.

All MGM brake motors are equipped with double seal ball bearings. The bearings are lubricated for life with a considerable grease reserve, the seals are made of synthetic rubber resistant to oil and to wear. On MGM brake motors belonging to BAX and BMX series can be installed bearings with a " $Z$ " shield instead of a "2RS" one.

| Frame size | Bearing type |  |
| :---: | :---: | :---: |
|  | Drive end ( D $^{\text {a }}$ | Nor-drive end (ND) |
| 56 | 6201-2Z | 6201-2Z |

The nominal bearings lifetime is expressed in working hours reached or exceeded by $90 \%$ of the same bearings under certain test conditions.
The key parameters that affect bearings life are the load applied on the bearing, the rotation speed and the operating temperature. The values in the table are referred to the case in which there's only radial load.
It also assumes that the radial force doesn't change in intensity and direction. The point of force application is the center line of the shaft end (as shown) with the motor in horizontal position. Values in the table show the maximum applicable force on the shaft to obtain the duration described in the table. The force is stated in Newtons (N).

* For motors with shaft height 315, contact MGM to receive specific information according to the type of mounted bearing.

The brake motors belonging to the BA series with the DC brake and all BM series motors (except those with voltage lower than 42Vdc) are equipped with a rectifier located inside the terminal box. These rectifiers can be half wave or full wave type according to the voltage supply (AC side) and to the required brake coil voltage ( DC side). Rectifiers come standard with over-voltage protection devices. Rectifiers are provided with two connection options (fig. 1-diagram A and B) for fast and slow brake reaction time. Rectifiers can be provided in C type (integrated in the terminal box cover-fig. 2), Q type (with loose wires-fig. 3), or M type (with clamp terminals-fig. 4). The rectifier resin colour identifies the rectifier rated voltage as indicated in the table below.

| Resin colour | Applicalie volage (Vax) | Outpuit voliage (Nis) | Standard values ( $\mathrm{Nac}_{\text {c }} \rightarrow V_{\text {lic }}$ ) |
| :---: | :---: | :---: | :---: |
| Blue | 200-265 | $0.45 * \mathrm{~V}_{\text {ac }}$ | $230 \rightarrow 103$ |
| Yellow | 360-440 | $0.45 * \mathrm{~V}_{\text {ac }}$ | $400 \rightarrow 180$ |
| Green | 90-130 | $0.9 * V_{\text {ac }}$ | $110 \rightarrow 100$ |

$V_{a c}$ refers to the input $A C$ (rms value) voltage while $V_{d c}$ refers to the mean value of the output DC voltage.
The following models are also available upon request:

## Model R

This type of rectifier is recommended when a faster brake engaging time is required and if an external contact on the DC circuit isn't available. A relay, integrated in the rectifier circuit, allows in an independent way to open the circuit on the DC side.

## Model P

This type of rectifier is recommended when a fast brake release and/or a higher braking torque is needed. This rectifier is designed in such a way to provide initially twice the rated output voltage allowing the brake coil to quickly attract the moving element.

The Electromagnetic compatibility requirements (standard EN 60034-1) apply to motors that are supplied directly to the end-user (for DC brakes, depending on the type of the rectifier installed, an additional optional EMC filter could be required).For more information please contact us. The motor is usually a component that is incorporated into a machine or system on which the EMC behavior depends, consequently the solutions adopted they must be considered as a whole. According to the provisions of the EN 60034-1 standard, motors intended to be incorporated as components in a machinery whose enclosure and final assembly affect EMC emissions are subject to EMC regulations relating to the final product. The machine manufacturer is responsible for compliance with the EMC directive 2014/30 / EU.

MGM motors are provided with a standard voltage rating of $230 / 400 \mathrm{~V} \pm 10 \% 50 \mathrm{~Hz}$ (IEC 60038) "European voltage". On request they can be provided with different operating voltages. The operating voltages at 50 Hz and 60 Hz are clearly indicated on the motor nameplate (see motor nameplate section). MGM motors are suitable to work within a voltage variation of $10 \%$ on the nameplate voltage. The available rated voltages are shown in the table below under "Nameplate voltage" at 50 Hz and 60 Hz , while the corresponding voltages on which the motor is able to run are shown under "Usable voltage". Only the most commonly required voltages are present, different voltages are available. For more information contact MGM.

## Operating at 60 Hz

MGM motors with rated voltage of $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}$ maintain the same rated and starting torque if operating at $277 / 480 \mathrm{~V} 60 \mathrm{~Hz}$ (or $265 / 460 \mathrm{~V}$ 60 Hz ), while the RPM increases by about $20 \%$ (see torque vs. RPM curves 1 and 2 here below). The AC brake coil on the BA (X) series works equally well if operating either at $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}$ or at $277 / 480 \mathrm{~V} 60 \mathrm{~Hz}$ (or $265 / 460 \mathrm{~V} 60 \mathrm{~Hz}$ ). The DC brake coil with nameplate voltage of $110 \mathrm{~V}, 230 \mathrm{~V}$ or 400 V on the BM and BA series has to be supplied at $110 \mathrm{~V}, 230 \mathrm{~V}$ or 400 V single phase respectively both at 50 Hz or 60 Hz (i.e. a 230 V brake can be supplied single-phase at 230 V 50 Hz or at 230 V 60 Hz ).
MGM is able to provide motors and brake coils suitable for operating on $220 / 380 \mathrm{~V} 60 \mathrm{~Hz}$ power supply. It is not advisable to run motors designed for $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}$ and and $277 / 480 \mathrm{~V} 60 \mathrm{~Hz}$ (or $265 / 460 \mathrm{~V} 60 \mathrm{~Hz}$ ) on $220 / 380 \mathrm{~V} 60 \mathrm{~Hz}$ voltage supply, as the power remains the same, but the starting torque is reduced by $35 \%$ (see curves 1 and 3 here below). MGM strongly recommends not to use a $277 / 480 \mathrm{~V} 60 \mathrm{~Hz}(230 / 400 \mathrm{~V}$ 50 Hz ) AC brake coil on $220 / 380 \mathrm{~V} 60 \mathrm{~Hz}$ power system as it results in a significant loss of performance.
DC brakes with a rated voltage of 230 V 50 Hz can be used on 220 V 60 Hz , and those with a rated voltage of 400 V 50 Hz on 380 V 60 Hz power system. The diagram below shows different curves (torque vs. RPM) for a $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}(277 / 48060 \mathrm{~Hz}$ ) rated voltage motor running on different power systems.
$230 / 400 \mathrm{~V} 5 \mathrm{~Hz}(277 / 480 \mathrm{~V} 60 \mathrm{~Hz})$ rated voltage motor running on $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}$ power system.
$230 / 400 \mathrm{~V} 5 \mathrm{~Hz}(277 / 480 \mathrm{~V} 6 \mathrm{~Hz})$ rated voltage motor running on 277/480V 60 Hz power system.
(3)
$230 / 400 \mathrm{~V} 5 \mathrm{~Hz}(277 / 480 \mathrm{~V} 6 \mathrm{OHz})$ rated voltage motor running on 220/380V 60 Hz power system.

It's important to point out that, if running the motor at 60 Hz instead of 50 Hz , the maximum number of starts reduces by about 15-20\%, and the noise level increases by about 3dB due to the increased speed of the cooling fan.

The most common duty types are described in this paragraph and a method to calculate the permissible power rise-up is given. Please contact MGM for different types of duty.

Continuous duty S1
The motor operates with constant load for a period of time sufficient to achieve the thermal equilibrium.

Limited length duty S2
The motor operates with constant load for a limited period of time not sufficient to achieve a thermal equilibrium. The remaining period of the cycle is a rest period, during which the motor cools down to the ambient temperature again.

Periodic intermittent duty S3
The motors follows a cycle including an operation period with constant load (ts) and a rest period (tr). The synthetic indication of the duty is given by the intermittent percentage ratio related to a period of time, which usually is 60 min. (f.e. 15\%-60 min.)
Intermittence ratio $=\frac{t s}{t s+t r} \cdot 100 \%$

Periodic intermittent duty with starting S4
The motor operates on identical cycles, significant startup time (ta) and a period with a constant load (ts). In the residual cycle time, the motor is under rest conditions (tr). Intermittent duty means that no thermal equilibrium is reached during the operating part of the cycle.

The proper indication for this cycle is S 4 followed by the intermittent duty ratio, by the motor moment of inertia ( $\mathrm{J}_{\mathrm{M}}$ ) and by the load moment of inertia ( $\mathrm{J}_{\text {ext }}$ ), with the latter two referred to the motor shaft. S4 Intermittent duty power temperature.

Example: S4 $25 \% J_{M}=0.15 \mathrm{kgm}^{2} \mathrm{Jext}=0.7 \mathrm{kgm}^{2}$
Intermittent duty ratio $=(\mathrm{ta}+\mathrm{ts}) / \mathrm{tc}$

All MGM motors are designed to be suitable for inverter duty. See below to understand the motor operating under inverter control.

The motor speed depends on the power supply frequency. Basically the inverter works converting the power input from the line with a fixed amplitude and frequency (f.e. 400 V 50 Hz ) into a voltage supply with a variable amplitude and frequency suitable to control the motor speed. Inverter can't generate an output voltage higher than the input voltage while it can increase the frequency above the input rated value; "Constant torque" regulation range indicates a range where the inverter is able to keep the nominal ratio of voltage to frequency constant; in our diagram this range is up to 50 Hz . "Constant power" (or flow) regulation range means a range where the inverter can increase frequency (and so the motor rotation speed), without voltage increase to the motor (and consequently the torque); in our diagram this range exceeds 50 Hz ; Operating diagram shows the percent values of the torque available both in continuous and overloading running. When the motor is running within "constant torque" range (frequency below 50 Hz ), it is necessary to check that continuous running at low speed does not cause overheating.
In fact, the reduced self cooling of a motor running at low speed may cause a rise in the windings temperatures up to dangerous values for their integrity. In such situations it is recommended the use of motors with forced ventilation (-SV / -AV series). It is also advisable to use the temperature sensors to detect the temperature. When the motor is running within "constant power" range (frequency above 50 Hz ), it is necessary to check if the torque required by the load does not exceed the torque indicated on the operating diagram, otherwise malfunction and eventual intervention of inverter overload protection devices could occur.
It is possible to extend the constant torque range up to 87 Hz ( 104 Hz for 60 Hz environments) by connecting the motor in Delta rather than in Star (e.g., with inverter supply 400 V 50 Hz and motor $230 / 400 \mathrm{~V} 50 \mathrm{~Hz}$ ). When connected in this way the motor can deliver up to 1.7 times the rated power and as a consequence the Inverter (Variable Frequency Drive) has to be sized to provide an higher current than rated. The primary benefit of this solution is that the motor extends its constant torque range and the motor can provide the rated torque up to 1.7 times the motor RPM.

The brake should be supplied separately from the motor on brake motors controlled by inverters, to ensure the correct operation of the brake coil. In this case the double terminal board box option must be requested. On brake motors with AC brake coil, it is also advisable to use a safety overload cutout (MGM type RCO4) on the power supply of the brake coil.

The starting torque of a motor running on inverter is different from the one of a motor connected directly on line. Be sure to select an inverter with technical specifications suitable for the work load of the machine it is intended to be used on.

An inverter leads to a non-sinusoidal supply waveform. Because of undesirable harmonic components added to the underlying power supply, a motor controlled by an inverter has higher losses, and an increased vibration and noise level. The efficiency reduction varies according to the type of inverter used.

Please contact MGM technical staff when using inverters with power supply higher than 400V or when using long cables between the motor and the inverter as both situations can be critical for the motor winding insulation system. In these cases the option "Winding with reinforced insulation" is suggested.

The interference generated by electronic power devices such as inverters, can influence equipment sensitive to interference, such as computers, load cells, photocells, temperature regulators, magnetic intrusion switches or capacitance grounding circuits, etc. The disturbances generated by the inverters propagate via the motor supply cables, the inverter supply cables, the grounding circuit, the control wires. Whenever it is necessary to reduce the interference caused by the inverter the following practical suggestions should be implemented. Disturbances are highest nearby the inverter and can be attenuated by increasing the distance. Sensitive devices should be kept at least 50 cm from frequency converter devices. The power wiring should be kept at least 50 cm away from the control wiring. Use power cables as short as possible. Power cables longer than 10 m are a strong source of disturbances and can cause malfunctions. Verify the necessity of mounting an appropriate filter on the power supply line.

MGM brake motors are dynamically balanced with half a key inserted in the shaft keyway. The table below provides the vibration limits for the different frame sizes as set forth in EN60034-14. As standard, motors are supplied with normal class balancing (class A), upon request with class B.

| $\begin{aligned} & \text { Vibration } \\ & \text { grade } \end{aligned}$ | Shatt height (mm) | $56 \leq H \leq 132$ |  | H $>132$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Mounting | Displacement IIII | Velocity mm/s | $\begin{gathered} \text { Displacement } \\ \text { \\|III } \end{gathered}$ | Velocity |
| A | Free suspension Rigid mounting | $45$ | $2.8$ | $\begin{aligned} & 45 \\ & 37 \end{aligned}$ | $\begin{aligned} & 2.8 \\ & 2.3 \\ & 2.8^{\star} \end{aligned}$ |
| B | Free suspension Rigid mounting | $18$ | $1.1$ | $\begin{aligned} & 29 \\ & 24 \end{aligned}$ | $\begin{aligned} & 1.8 \\ & 1.5 \\ & 1.8^{\star} \end{aligned}$ |

* Please refer to the standard EN 60034-14 or contact MGM for further details.

Reducing vibrations is important both to avoid motor damage, especially to the bearings, and to avoid damage to the machinery the motor is coupled to. It is advisable to balance the parts of the attached machinery (coupling, pulleys etc.) in order to avoid vibrations.

## Noise

The noise of a running electric motor is mainly generated by the magnetic field, from the bearings and from the cooling system. The most relevant noise is generated by the cooling fan. Technical data sheets report the values of the sound pressure in $\mathrm{dB}(\mathrm{A})$ according to ISO 1680. The values are referred to a 50 Hz functioning. These values should be increased by $3 \div 5 \mathrm{~dB}$ about on motors operating at 60 Hz due to the higher rotation speed and therefore of the fan. If motors are driven by an inverter its supply is not purely sinusoidal with higher levels of vibrations and motor noise. On request it is possible to provide motors with low noise level. During the braking action, the noise level depends on the air gap (i.e. the distance between the brake coil and the brake moving element). A periodic air gap adjustment provides lower noise levels.

Manual brake release might be needed to perform maintenance on the machine where the motor is installed or to manually operate the machines in case of power supply failure.
BA Series motors are equipped with a central screw to manually release the brake (for the BAH series motors there are 2 side screws). This is a 'locking' type brake release so that the brake stays disengaged until the screw is tightened on the brake assembly. Upon request the brake can be provided with a non-locking mechanism (fulcrum style).

On BM Series motors the hand release (non-locking type) is supplied on request and it's a side lever to manually release the brake. The lever is mounted on the same side as the terminal box, unless otherwise requested.

BA and BM series motors up to frame size 132 mm (NEMA 245) come equipped with a hex socket on the non-drive end to manually rotate the shaft with a hex wrench once the brake is disengaged. This standard feature (MGM patent) is very useful for all those applications requiring manual positioning or a machine reset. Most of the times this feature prevents the use of a special double
 shaft extension needed for manual rotation. Upon request it's also possible to have motors equipped with this hex socket on frame sizes 160 and over (IEC 160 to 315).

Safety warning: when the brake is manually released the motor shaft is no longer braked therefore is free to rotate. For this reason the manual brake release must be operated only when there are no safety concerns for any applied or suspended load. Brake must be always properly reengaged once the manual intervention is completed. Motors shall never be started with any tool inserted in the motor hex socket. Such tools must be properly removed after any manual intervention. Failure to heed these warnings could lead to serious injury and/or damage.

## temperature, altitude, humidity

The standard electrical specifications of the motors are referred to continuous duty ( S 1 ), nominal voltage, nominal frequency ( 50 to 60 Hz ), an ambient temperature of max $40^{\circ} \mathrm{C}$ and installation elevation up to 1000 m . above sea level. If ambient temperature is higher than $40^{\circ} \mathrm{C}$ the permissible output power should be reduced by a percentage of the rated value (see the table below).

| Ambient Temperature | $40^{\circ} \mathrm{C}$ | $45^{\circ} \mathrm{C}$ | $50^{\circ} \mathrm{C}$ | $55^{\circ} \mathrm{C}$ | $60^{\circ} \mathrm{C}$ |
| :--- | :---: | :---: | ---: | :---: | :---: |
| Permissible Output Power as \% of the Rated Power | $100 \%$ | $96.5 \%$ | $93 \%$ | $90 \%$ | $86.5 \%$ |

If ambient temperature is higher than $60^{\circ} \mathrm{C}$ or lower than $-30^{\circ} \mathrm{C}$ please contact the MGM technical office. If the motor is going to work at an altitude of more than 1000 m . above sea level, the permissible output power should be reduced by percentage of the rated value (see the table below).

| Altitude above sea level | 1000 m. | 1500 m. | 2000 m. | 2500 m. | 3000 m. | 3500 m. |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Permissible Output Power as \% of the Rated Power | $100 \%$ | $97 \%$ | $94.5 \%$ | $92 \%$ | $89 \%$ | $86.5 \%$ |

Motors working in low temperature or high moisture environments
If a motor has to be used in an environment where the temperature is lower than $-1^{\circ} \mathrm{C}$, in high moisture or where abrupt temperature changes can occur, it is advisable to use anti-condensation heaters. This recommendation is particularly important where there are long pauses between working cycles, which may cause abundant condensation on the motor windings. It could permeate the windings and cause short circuits. This occurs mostly on larger motors, which contain more air volume inside, allowing more humidity to condense. Two anti-condensation heaters are fitted on the windings heads in order to increase the internal motor temperature as to prevent the air condensation.
Three different types of heaters are used according to the motor size. The wiring leads of the heaters are connected to the terminal board located in the terminal box. The presence of anti-condensation heaters is shown by the writing "SCALD" followed by the required supply voltage in the field 29 of the nameplate (according to nameplate paragraph). Space heaters must be supplied to prevent moisture condensation in the motor during times the motor is not running. The heaters must not be supplied during the normal motor operation.

Additional protection against moisture may be provided by the realization of drain holes on the motor to allow water drainage. Drain holes option is provided on request only and it is necessary to specify in the order the mounting to properly position the holes on the motor.

As standard MGM motors have the stator winding and brake coil treated to work in tropical environments. However a specific tropicalization treatment can be requested, for all motors that have to be installed in high humidity environments.

For the BM series a rain roof is available on request, for outdoor use or in presence of water jets with vertical mounting and shaft down. The rain roof is positioned above the fan cover protecting the motor from water and permitting the regular flow of the cooling air. There is no need of a rain roof on BA motors thanks to its particular construction and the use of a special brake cover for outdoor vertical mounting. When brake motors are used in elevated moisture environments or where there are long periods between working cycles, brake disc sticking can occur. To avoid disc sticking it is possible to provide zinc plated or stainless steel brake friction surfaces according to the motor type.

The motor should be provided with protection devices to protect against non ordinary working conditions. The use of protection device on the line is particularly advisable (i.e. varistors) for those motors running at low speed ( $8,12,16$ poles) to prevent early wear of windings and of contacts caused by voltage peaks during the switching on. It is advisable to use proper torque limiters in those application where the motor shaft could be impeded. The chart below reports the most effective protection devices for the most frequent occurring problems.

| Operation condilitions | Protection type |  |  |
| :---: | :---: | :---: | :---: |
|  | Fuses | Protective circuit hreakers | Thermal protective device on the windings |
| Excess currents 200\% In | no protection | excellent protection | excellent protection |
| Heavy starts, reversing operation | no protection | partial protection | excellent protection |
| Stalling | partial protection | partial protection | partial protection |
| Starting on two phases | no protection | partial protection | excellent protection |
| Voltage deviations | no protection | excellent protection | excellent protection |
| Frequency deviations | no protection | excellent protection | excellent protection |
| Insufficient motor cooling | no protection | no protection | excellent protection |

On request MGM is able to supply motors equipped with:
Bimetallic Thermal Protectors (PTO): three bimetallic sensors in series with normally closed contacts, fitted on the windings heads. They control a switch (not provided with the motor) that interrupts the power supply when getting close to a dangerous temperature. The nominal voltage and current are 250 V and 2,5 A AC. The contact closes again with a temperature reduction of at least $35^{\circ} \mathrm{C}$. The bimetallic thermal protectors leads are connected to a terminal board located in the main terminal box.
The temperature of intervention of the sensors is $140^{\circ} \mathrm{C}$. Different temperatures of intervention are avaible on request.
Thermistors (PTC): three thermistors in series (conforming to DIN standards 44081 and 44802), fitted on the windings heads. The resistance of the thermistors changes with temperature and when getting close to the nominal intervention temperature the sharp increase of resistance guarantees a precise intervention of the safety devices. The thermistor only senses the temperature so a cut-out device (not provided with the motor) must be added to interrupt the power supply to the motor. The maximum PTC operating voltage is 30 VDC . The PTC leads are connected to a terminal board located in the main terminal box.
The temperature of intervention of the the sensors is $130^{\circ} \mathrm{C}$. Different temperatures of intervention are avaible on request.
PT 100 sensors: sensors (conforming to DIN EN 70751) fitted on windings heads. The resistance of PT 100 sensors linearly changes with temperature.

## Over-voltage protection

Brake coil: DC brake coil is supplied as standard with a rectifier fitted with an over-voltage protection device. The AC brake coil doesn't generally need this type of protection devices. In case of a very high start/stop frequency or in case of critical line voltage situation it is recommended the use of RCO4 filter in order to limit the electrical stress on the brake coil.

Low speed motors: when starting motors with a high number of poles (i.e. $8,12,16$ ), voltage peaks can be generated damaging the motor insulation materials and contacts. In these cases it is advisable to install safety over-voltage protection devices. On request MGM provides overvoltage protection devices such as RC04 for motors up to 4 kW and RC10 for motors up to 10 kW . Please note that these devices should not be installed if the motor is controlled by an inverter.
Brake monitoring system: The monitoring devices of the brake group allow you to check the status and necessary maintenance activities by checking the status of the brake (ON / OFF) and wear of the friction linings. The different options are: Microswitch to check the wear of the brake disc friction lining and / or to check the position of the brake moving element. They are mechanical switches with Normally Open (NO) or Normally Closed (NC) contacts that change their state when the brake wearing reaches critical levels and / or changes in the position of the moving element (free or locked motor rotation). They require for monitoring only one electrical connection (AC or DC). They are available for the BA and BM series starting from axis height 63 . Inductive sensors: provide more information than mechanical sensors. They can have a digital or analog output. Are available on request with a special safety classification (SIL2 or SIL3). They are larger in size than mechanical switches and require DC power supply. They are available starting from axis height 90 for the $B A$ and $B M$ series. They can be supplied together with the Intelligent System of integrated brake monitoring (SMF) that allows you to know a lot of information regarding the state of the brake, the state of the sensors, the cycles of braking, with a simple connection. The controls allow you to continuously determine the position of the brake moving element and therefore to monitor the variation of the air gap, the wear of the brake disc and the position of the moving elemnt. Other quantities, such as temperature can be added. This system, easily interfaced, allows you to organize and drive a more efficient and effective one even remotely maintenance.

## efficiency

Efficiency indicates how well an electric motor transforms electrical energy into mechanical energy. The higher the efficiency of a motor in specific operating conditions, the lower is its energy consumption.
International standard IEC 60034-30-1 defines efficiency classes through the code "IE" followed by a number.

## IE1 (standard efficiency) <br> IE2 (high efficiency) <br> IE3 (premium efficiency) <br> IE4 (super premium efficiency)

The Standard IEC 60034-30-1 defines motor efficiency classes, but it doesn't legally determine minimum efficiency requirements. As a matter of fact the standard does not specify if motors shall comply with a minimum efficiency class. Minimum efficiency standard are instead specified by individual countries laws.

The new European regulation (regulation EU 2019/1781), it establishes new requirements for brake motors rated for operation on a $50 \mathrm{~Hz}, 60$ Hz or $50 / 60 \mathrm{~Hz}$ sinusoidal voltage, rated voltage above 50 V and up to and including 1000 V and continuous duty ( $\mathrm{S} 1, \mathrm{~S} 3 \geq 80 \%, \mathrm{~S} 6 \geq 80 \%$ ) operation, starting from the $1^{\text {st }}$ of July 2021.

## Starting from the $1^{\text {st }}$ of July 2021:

- three phase brake motors with rated power $0.75 \mathrm{~kW} \leq \mathrm{P}_{\mathrm{N}} \leq 1000 \mathrm{~kW}$ with 2, 4, 6, 8 pole, must be IE3.
- three phase brake motors with rated power $0.12 \mathrm{~kW} \leq \mathrm{P}_{\mathrm{N}}<0.75 \mathrm{~kW}$ with $2,4,6,8$ pole, must be IE2.

## Starting from the $1^{\text {st }}$ of July 2023:

- single phase brake motors with rated power $\mathrm{P}_{\mathrm{N}} \geq 0.12 \mathrm{~kW}$ with $2,4,6,8$ pole, must be IE2.

The new regulation doesn't apply to some types of motors among which 2 speed motors and TENV motors.
BAX and BMX series motors (three phase brake motors) with efficiency class IE2 (rated power $\mathrm{P}_{\mathrm{N}}<0.75 \mathrm{~kW}$ ) and IE3 (rated power $\mathrm{P}_{\mathrm{N}} \geq 0.75 \mathrm{~kW}$ ) comply with the new efficiency regulation. As for the brake assembly, the BAX and BMX series maintain the same technical characteritics of the corresponding motor of the BA and BM series.

Motor Efficiency regulations are different for each country in the world with regards to minimum efficiency levels, exclusions and deadlines. As regulations are subject to changes please contact MGM for the most updated information about efficiency regulations.

For a quick calculation of the annual economic savings using a motor with an efficiency (effa) instead of a motor with an efficiency (effb) with the same rated power you can consider the following formula:

Annual economic savings $=H_{\text {year }} \times \mathrm{kW} \times \%$ FL $\times$ Costkwh $x\left(1 / \mathrm{eff}_{\mathrm{a}}-1 / \mathrm{eff}_{b}\right)$
$H_{\text {year }}=$ annual motor running (hours)
kW = motor rated power (kW)
$\%$ FL = fraction of full load power at which motors effectively run
Costkwh = electricity cost
$\mathrm{eff}_{\mathrm{a}}=$ motor 'a' efficiency (\%) at the effective load condition / 100
eff $f_{b}=$ motor 'b' efficiency (\%) at the effective load condition / 100
$100 \%$ of manufactured motors undergo a final routine test and safety checks (dielectric rigidity and the insulation resistance test) as well as a no load test. Upon request, at the purchase order time, motors can be provided with the relevant MGM routine test certificate. The certificate reports the motor serial number and the routine test results.

The following documents can also be provided on request:
Type Test Certificate: this certificate represents the tests carried out on prototypes or on samples from production. It reports data concerning the type of motor therefore it doesn't report specific motor information. It provides the data from the motor at "no load" and at "load" as well as the electrical safety tests. The motor serial number isn't provided in such a certificate.

Test Certificate: this certificate represents the tests carried out on a specific motor. It provides the data from the motor at "no load" and at "Ioad" as well as the electrical safety tests. This time the motor serial number is provided in such a certificate.

Additional tests such as noise, vibration, brake torque, dimensions and protection degree (enclosure) rating can provided by MGM upon request at the time of the purchase order. Please contact MGM to be quoted concerning the above tests and certificates.

## Painting

The table below shows the available painting plans. MGM primarily chooses water-based paint rather than solvent-based ones in order to minimize the environmental pollution impact. Unless otherwise specified or required by the application, aluminium parts are provided unpainted.

| Painting lanns | Notes | Interided use |
| :---: | :---: | :---: |
| Standard | All cast iron parts are painted with water-based paint. Brake cover is powder coated both internally and externally. Aluminium parts are left unpainted. Body, flanges and end-bells of motors from frame size IEC 160 and over are made of cast iron, and painted externally with waterbase epoxy paint. The MGM standard colour is RAL 5010 . | Industrial environments, no harsh chemicals and protected from the weather. |
| Outdoor | One epoxy primer coating and one coating of enamel. | Industrial environments with high humidity levels, no harsh chemicals, outdoor installations exposed to the weather (not in proximity to coastal areas) with moderate pollution. |
| Marine | Two coatings of epoxy primer and one coating of enamel. | Industrial environments with high humidity, moderate environmental contamination, outdoor installations exposed to weather, coastal areas with moderate salinity (not offshore). |
| Offshore | One coating of epoxy primer, two coating of epoxy paint, one coating of enamel. | Installations on vessels/ships or offshore units. |

Upon requests, painting plans can be applied according to corrosion classes (C3, C5-M, etc.) as set forth in the ISO 12944 standard (Paints \& Varnishes - Corrosion protection of steel structures by protective paint systems).

On request an additional corrosion protection on the internal parts like rotor, casing, stator, etc. can be provided (stated as 'VER-INT') and, still on request, a winding tropicalization treatment can be applied ('TROP').

Painting plan and colour RAL number shall be specified at the time of the purchase order. Make sure that the protection (enclosure) rating is suitable for the intended installation and evaluate if the application requires drain holes and/or anti-condensation heaters.

On request it's possible to supply the cast iron components in ductile cast iron.

Me BA-BAX series
B5

## BA-BAX Series

BA series consists of three phase, asynchronous brake motors. The brake is activated in case of power supply failure. The brake torque remains the same in both directions of rotation and the motor brakes without shaft axial sliding. As standard the brake is AC 3-phase voltage supply with brake leads connected with motor leads in a single terminal board box while. On request it is possible to supply the brake separately with a second terminal board or to have a DC brake supply with a built-in rectifier fitted inside the terminal box. The rectifier is provided with over-voltage protection devices.In the technical data tables, the BA series motors are proposed in the BAX version for continuous duty with IE2 / IE3 efficiency class (compliant with EU regulation 2019/1781), alternatively they can be supplied in the BA 'Enhanced version Power 'only for intermittent service (S3 $60 \%$ ). BA series motors tolerate high overloading rates and are capable of withstanding overheating in such a way that guarantees the best reliability even under tough operating conditions. All MGM series motors have been designed to be controlled by inverters. The motor winding insulation is class F, while class H is available on request. Motor construction type is totally enclosed externally cooled (TEFC) and IP54 enclosure (IP55 on request). For higher protection degree (IP56-IP65-IP66) we recommend to use the BAH version (see page 56 for more info). Motors up to 132 frame size are fitted as standard with a hexagonal hole on the shaft at the non drive end to allow manual rotation, even if power is off. All BA series motors are provided as standard with hand brake release screw.
BA series brake disc has a large lining surface that allows high brake torque, low disc wear and consequently low maintenance cost. The brake torque can be easily adjusted to the desired value just by screwing some nuts. Thanks to its special construction the brake friction surface is selfventilated on the motor side, permitting a high brake workload and keeping brake time constant. The brake lining material is asbestos free.
BA series motor frame is made of die cast, light metal on motors up to 132 size and the terminal board box, provided with cable glands and plugs, is positioned $180^{\circ}$ above the motor support feet. The frame is made of cast iron starting from 160 frame size and the terminal box is located on the right side (drive-end view). Shields and flanges are made of aluminium on motors up to 90 frame size, and of cast iron on motors of 100 frame size and above. As standard feet are frame integrated (they are not simply attached to the frame) on IM B3 mounting (foot mounted) making the motor very sturdy. This feature is very important for those applications where the motor is much stressed during the starts and stops. The brake friction surfaces are made of cast iron as a standard. The brake moving element and the brake coil have a laminated nucleus to reduce electrical losses and to secure a very quick brake intervention.
BA series main features are its sturdy construction, quick braking action, constant braking time, high number of permissible start/stop cycles also under severe applications, easily adjustable brake torque, low maintenance costs.

## Air gap adjustment

The air gap (60), that is the distance between the two magnetic cores, the brake coil (25) and brake moving element (24), must stay within the value expressed in the chart below. It is not advisable to exceed the expressed value, in order to avoid vibrations of the brake moving element, very loud noise, the brake coil burning or even the whole brake assembly failure. It is advisable to check periodically the air gap because it increases as a consequence of the brake disc wear. In order to set the air gap to the indicated value, loosen the nuts (21-22) so to move the brake coil (25) towards the brake moving element (24). Once this operation has been settled be sure to tighten the locknuts. The above mentioned procedure isn't valid for BA 250-280 serie-motors, for which we please you to contact us.

| Frame Size | $71-80$ | $90-100$ | $112-132$ | $160 \div 200$ | $225 \div 315$ |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Min Air Gap [mm] | 0.25 | 0.3 | 0.35 | 0.45 | 0.5 |
| Max Air Gap [mm] | 0.6 | 0.7 | 0.8 | 1.0 | 1.1 |

## Brake torque adjustment

The brake torque is proportional to the springs (18) compression, which can be adjusted tightening or loosening the locknuts (20). The compression of the three springs must be as even as possible. Once the brake is properly supplied, if the brake coil isn't able to attract the brake moving element with a quick stroke and to keep it attracted without any vibrations, check the air gap adjustment. If this inconvenience still persists, loosen the locknut (20) by two threads and try again until the proper functioning is obtained. It is important to consider that some motors can be equipped with 3 springs and some others with 6 (see page 27). Once this operation is completed, check the brake torque to make sure it is set to the desired value. Never set the brake torque to a higher value than the one indicated on the motor nameplate.

## Permissible start frequency at load

The technical data tables provide the ideal no-load start frequency (Zo). The permissible start frequency when an external load is applied (Zoad) can be found with the following formula:

$$
Z_{\text {load }}=Z_{0} \cdot K \cdot R
$$

where " $Z_{0}$ " is the table-value for the selected motor and " $K$ " and " $R$ " are factors determined by the curves on the side; the factor " $K$ " is related to the ratio of the moment of inertia of the applied load ( Japp ) and to that of the motor ( Jmot ) while the factor " R " is related to the ratio of the resisting torque ( $\mathrm{T}_{\mathrm{r}}$ ) to the starting torque ( $\mathrm{T}_{\mathrm{s}}$ ). This calculation gives an approximative indication only and it has to be operatively tested for confirmation. If the required starting frequency is close to Zoad, it is advisable to use a motor equipped with thermal protectors. It is necessary to check the maximum energy dissipation limit of the brake group and the maximum motor RPM in those applications where high moment of inertia is involved. On request, a special brake disc material is available, which is capable of withstanding a very high dissipation energy. Please contact MGM technical staff for additional information.

## Brake coil wiring diagram

As standard BA series motors are equipped with AC brakes with single terminal board for the brake and the motor, while on request it is possible to supply the brake separately. The AC brake coil can be star or delta connected. On request DC brakes are available for BA series with the rectifier located inside the terminal box. The rectifier is provided with over-voltage protection devices and with a RFI filter. MGM brake motors equipped with DC brakes can be connected as in diagram A or B according to the required braking time. MGM motors provided with DC brake coil are connected as diagram A. The DC brake coil has to be connected according to diagram B to have a reduced brake reaction time.

DC

## brake torque and brake springs compression

BA Series motors are provided with a brake torque set to $60-70 \%$ approx of the maximum admissible brake torque of the AC brake (see the table below). On request the motor can come already set to a specific brake torque value different from the standard one. The brake torque is shown in the diagrams here below as a function of the brake assembly spring compression; for BA 225-315 motors diagrams please contact MGM.
The shown values refer to $B A$ series motors mounted in horizontal position with an AC brake coil. DC brakes have the same trend as AC brakes even if they have lower brake torque, as shown in the table below. For BAK 90-132 motors series the brake torque changes in a different way than shown in the diagrams. Please contact MGM for further information. The values shown in the diagrams are only indicative as application conditions, brake lining wear and temperature, can affect the real brake torque. Whenever it is necessary to adjust the braking torque to a specific value it is advisable to directly measure the obtained brake torque after each brake torque adjustment. Consider that the motor mounting position influences remarkably the effective braking torque when low brake torque values are involved. It is not recommended to adjust the brake torque at values below $40 \%$ of the maximum value indicated on the motor nameplate. Please contact MGM for further information.

*** The EN 60034-30-1 standard specifies the IE efficiency classes for motors with power between 0.12 kW and 1000 kW . For motors with lower power it is therefore not possible to define the efficiency class, moreover these motors are outside the scope of the EU regulation 2019/1781.

1. Motor characteristic values reported in the tables refer to 50 Hz frequency, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m . above sea lever operating conatition.
2. DC brake is provided on request only, on BA series motors. Brake current consumption values refer to a rated voltage of 3 -phase 400 V for AC brakes and single-phase 230V for DC brakes.
3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should
be regarded with a tolerance of $\pm 3 \mathrm{~dB}$.
4. Max brake torque and Zo values refer to AC brake. Go to pag. 27 for DC max brake torque values.
5. The expressed $Z_{0}$ values refers to AC Brake. $Z_{0}$ is the max number of no-load starts. It is meant for calculation purposes only, and is used to obtain the max number of starts with load according to the formula expressed at page 26. The number of starts with load (Zoad) is indicative and it has to be operatively tested for confirmation. The use of Thermoprotectors is strongly recommended when the operative number of starts

Starting current for an asynchronous motor is always much higher than the nominal current. When the starting time is excessively long, there are electromechanical disturbances and higher temperatures on the windings, damaging the motor. For information on maximum starting time allowed for each type of motor, please contact MGM. An indicative value for starting time $\mathrm{t}_{\mathrm{s}}$ (expressed in seconds) and the angle of rotation $\varphi_{a}$ (expressed in radians) can be obtained as follows:

$$
\mathrm{t}_{\mathrm{s}}=\frac{\left(\mathrm{J}_{\text {mot }}+\mathrm{Japp}\right) \bullet \cap}{9.55\left(\mathrm{~T}-\mathrm{T}_{\text {load }}\right)} \quad \varphi_{\mathrm{a}}=\frac{\mathrm{t}_{\mathrm{s}} \bullet \cap}{19.1}
$$

Where $\mathrm{J}_{\text {app }}\left(\mathrm{Kgm}_{2}\right)$ is the moment of inertia referred to the motor shaft, $\mathrm{Mload}(\mathrm{Nm})$ is the opposing torque to the motor, $\mathrm{J}_{\text {mot }}\left(\mathrm{Kgm}^{2}\right)$ is the moment of inertia of the motor, $n(R P M)$ is the rated motor RPM, $T$ is the average starting torque, $T=(0,8 \div 0,9) T s$ (see the technical data table for $J_{\text {mot }}, n$ and $\mathrm{t}_{\mathrm{s}}$ of the selected motor).
An indicative braking time $\mathrm{t}_{\mathrm{f}}(\mathrm{s})$ can be calculated as follows:

$$
\frac{\mathrm{Jtot} \bullet \mathrm{n}}{9.55\left(\mathrm{~T}_{\mathrm{b}} \pm \mathrm{T} \text { load }\right)}+\frac{\mathrm{tB}}{1000}
$$

Brake electrical reaction time $t_{B}(\mathrm{~ms})$

| Motor type | AC Brake | DC Brake (Standarl) | DC Brake (Cuick) |
| :--- | :---: | :---: | :---: |
| BA 71-80-90 | 7 | 80 | 20 |
| BA 100-112 | 9 | 80 | 30 |
| BA 132-160 | 12 | 85 | 30 |
| BA 180-200 | 12 | 90 | 30 |
| BAH 225 | 14 | 100 | 35 |
| BAH 250 | 14 | - | - |
| BAH 280 | 14 | - | - |
| BAH 315 | 14 | - | - |

where: Jot total moment of inertia at the motor shaft ( $\mathrm{Kgm}^{2}$ )
$n \quad$ motor RPM ( $\mathrm{min}^{-1}$ )
$\mathrm{T}_{\mathrm{b}} \quad$ brake torque (Nm)
$T_{\text {load }}$ resisting load torque ( Nm ) with $\boldsymbol{+}$ sign if matches the brake torque, or - sign if opposite
$t_{B} \quad$ brake electrical reaction time (ms)

The reported $t_{B}$ times are valid only if the motor is connected with the brake in parallel. In case the brake is supplied separately, the tB time has to be cut by 30-50\%. This calculation gives an approximative indication. Please contact MGM for further information.

Brake disc linings wear
The indicative number of start/stop ( $N_{\text {int }}$ ) that a brake motor can carry between two successive air gap adjustments can be calculated with the following formula:

$$
N_{\text {int }}=E_{r} / W_{f}
$$

where $W_{i}(J)$ is the energy dissipated during a single braking action and $E_{r}(M J)$ is the value that can be obtained from the table below. The following formula can be used to calculate the $\mathrm{W}_{\mathrm{f}}(\mathrm{J})$ :

$$
W_{\mathrm{t}}(\mathrm{~J})=1 / 2 \mathrm{Itot} \omega^{2}
$$

where lot is the total moment of inertia (the motor moment of inertia plus the inertia to the motor shaft) and $\omega(\mathrm{rad} / \mathrm{s})$ is the motor rotation speed. The table shows the $E_{r}(M J)$ values for the different frame sizes on the BA series motors with AC brake, BA series motors with DC brake, and BM series motors (DC brake standard). Multiply the values in the table by 0.5 in order to calculate the $\mathrm{E}_{\mathrm{r}}(\mathrm{MJ})$ values for BAPV motors and take into account the additional moment of inertia introduced by the flywheel. Even for BMPV series motors please consider the additional moment of inertia introduced by the flywheel.

| Motor type | $\mathbf{7 1}$ | $\mathbf{8 0}$ | $\mathbf{9 0}$ | $\mathbf{1 0 0}$ | $\mathbf{1 1 2}$ | $\mathbf{1 3 2}$ | $\mathbf{1 6 0}$ | $\mathbf{1 8 0}$ | $\mathbf{2 0 0}$ | $\mathbf{2 2 5}$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| BA with AC brake | 56 | 80 | 95 | 105 | 130 | 200 | 290 | 385 | 385 | 462 |
| BA with DC brake | 34 | 48 | 57 | 63 | 78 | 120 | 174 | 231 | 231 | 277 |
| BM | 15 | 23 | 29 | 36 | 45 | 60 | 70 | 110 | 110 | 190 |

Values shown in the table must be considered as indicative only. In fact, the wear of the brake disc linings is influenced by various factors (brakes cycling, energy dissipated at each braking, environment condition, brake torque, etc.). The friction surfaces temperature grows both with the frequency of the braking actions and with the moment of inertia applied to the motor. When brake friction surface temperature is high, brake disc linings wear increases, causing a variation in the stopping times.
On BA series motors the cooling fan is located between the motor body and the brake. This arrangement allows cooling down both the motor frame and the brake friction surface resulting in a reduced brake disc lining wear and in steadier stopping times.
The brake lining wear is greater during the braking in period (a few thousand stops). This aspect has to be taken into consideration when experimentally calculating the interval time required between two consecutive air gap adjustments.

B3

## BM-BMX series

BM series consists of three phase, asynchronous brake motors. BM series range starts from 56 up to 225 frame size. As standard the brake is DC voltage supply with a built-in rectifier fitted inside the terminal box. The rectifier is provided with over-voltage protection devices. Two different types of rectifier wiring can be chosen according to two different brake intervention time. The motor brakes in case of power supply failure. The brake torque remains the same in both directions of rotation and the motor brakes without shaft axial sliding.
BM series is designed in order to have a braking action as quiet as possible. BM series motors tolerate a high overloading rate and are capable to withstand overheating so to guarantee best reliability also under tough operating conditions. In the technical data tables the motors of the BM series are proposed in the BMX version for continuous service with IE2 / IE3 efficiency class (compliant with EU regulation 2019/1781), alternatively they can be supplied in the version BM 'Enhanced Power' only for intermittent duty ( $\mathrm{S} 360 \%$ ).All MGM motors have been designed to be controlled by inverters. The motor winding insulation is class F, while class H is available on request. Motor construction type is totally enclosed externally cooled (TEFC) and IP54 enclosure (IP55, IP56, IP65 and IP66 are available on request).
Motors up to 132 frame size are fitted as standard with a hexagonal hole on the shaft the at non drive end, to allow manual rotation, even if power is off. On request, BM series motors can be provided with a side manual brake release lever. The brake disc lining material is asbestos free and the lining mixture is formulated to have a high friction coefficient and a long life. BM series motor frame is made of die cast, light metal on motors up to 132 size and the terminal board box, provided with cable glands and plugs, is positioned $180^{\circ}$ above the motor support feet. The frame is made of cast iron starting from 160 frame size and the terminal box is located on the right side (drive-end view). On IM B3 mounting (foot mounted) feet are frame integrated (they are not simply attached to the frame) as standard and it makes the motor very sturdy. This feature is very important for those applications where the motor is much stressed during the starts and stops. Shields and flanges are made of aluminium on motors up to 90 frame size, and of cast iron on motors of 100 frame size and above.
BM series main features are the low braking noise, gradual acceleration during the motor start and stop and reduced overall dimensions.

## General description

BM series motors are equipped with DC brake coil. DC brake coil is supplied through a rectifier located in the terminal box (standard voltage supply is $230 \mathrm{~V} 50 / 60 \mathrm{~Hz}$ ). The rectifier is provided with over-voltage protection devices. The brake torque remains the same in both directions of rotation and the motor brakes without shaft axial sliding. Brake torque can be set loosening or tightening the adjustable springs (78) where available or in the presence of fixed springs, removing the central springs or replacing the springs with ones of another type.
Never set the brake torque to a higher value than the one indicated on the motor nameplate. BM series motors are fitted as standard with a hexagonal hole on the shaft at non drive end to allow manual rotation. On request BM series motors can be provided with brake release return lever located on the motor side.

## Air gap adjustment

The air gap (60), that is the distance between the two magnetic cores, the brake coil (75) and brake moving element (74), must stay within the value expressed in the chart below. It is advisable to check periodically the air gap because it increases as a consequence of the brake disc wear. In order to restore the air gap within the proper value, release the connecting screws (77), move the brake coil (75) towards the brake moving element (74) operating on the fixing screws (79). Once this operation has been settled be sure to tighten clockwise the connecting screws (77) so to fasten again the brake coil.

## Permissible start frequency with load

The technical data tables provide the ideal no-load start frequency $\left(Z_{0}\right)$. The permissible start frequency when an external load is applied (Zioad) can be calculated as follows:

$$
Z_{\text {load }}=Z_{0} \cdot K \cdot R
$$

where " $\mathrm{Z}_{0}$ " is the table-value for the selected motor and " K " and " R " are factors determined by the curves shown above; the factor " K " refers to the calculated ratio between the moment of inertia of the applied load (Japp) and that of the motor ( $\mathrm{Jmot}_{\text {m }}$ ) while the factor " R " is the calculated ratio between the resisting torque ( $T_{r}$ ) and the starting torque ( $T_{s}$ ). This calculation gives an approximative indication and it has to be operatively tested for confirmation. If the required starting frequency is close to $Z_{\text {load, }}$ it is advisable to use a motor equipped with thermal protectors. It is necessary to check the maximum energy dissipation limit of the brake group and the maximum motor RPM on those application where high moment of inertia is involved. Please contact MGM technical staff for additional information.

## Rectifiers wiring diagram

BM series brake motors can be connected as diagram A or B according to the required braking time. MGM motors are always provided with the DC brake coil connected as diagram A. The DC brake coil has to be connected according to diagram B in order to have a quicker braking action. Here below brake intervention times and brake release times are provided.

The chart here below describes the trend of the braking torque as a function of time, during the start (on the left) and stop (on the right). The table below also show times for each type of motor and the values of $\mathrm{Er}(\mathrm{MJ})$ to calculate the number of braking actions between two consecutive air gap adjustments. Values shown in the table must be considered as indicative only, as they can be influenced by various factors (air gap, voltages, temperature, rectifier type, etc.). The values shown in the table are referred to the case when the brake supply line is separated from that of the motor.

Tb Brake torque
Tbn Nominal brake torque

1. Motor characteristic values reported in the tables refer to continuous duty (S1), 50 Hz frequency, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m . above sea level operating condition.
2. The expressed brake torque is the max admissible one. Brake current consumption values refer to a rated voltage of 230 V AC single-phase. 3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should be reached.
be reached.
5 . $Z_{0}$ is the max number of no-load starts. It is meant for calculation purposes only, and is used to obtain the max number of starts with load according to the formula expressed at page 42. The number of starts with load (Zlaad) is indicative and it has to be operatively tested for confirmation. The use of thermal protectors is strongly recommended when the oper-
ative number of starts is close to the calculated Zoad. It is necessary to verify the max permissible brake energy dissipation and the max permissible RPM for applications with high moment of inertia.
3. MGM keeps the data provided as up-to-date and correct as possible. Since the products are subject to changes and improvements, the data indicated cannot be considered binding. The data indicated must also be understood as being general in nature. For specific applications, please
contact the MGM staff.

## BM-BMX series dimensions

B5

* 225S-225M 2 pole D=55 E=110
** BM200 motors have the following dimensions: $R 1=268, L 1=446, Q=893$, $Z 1=167, W 1=269.5, Y=355$

| Notes | M 16 on size 56 up to 63 |
| :--- | :--- |
| M 20 on size 71 up to 80 |  |
| M 25 on size 90 up to 112 |  |
| M 32 on size 132 |  |
| M 40 on size 160 up to 200 |  |
| M 50 on size 225 |  |

The BA and BM brake motors are available in the EP 'Enhanced Power' version. These motors can supply the indicated power in the tables below only in intermittent duty ( $\mathrm{S} 360 \%$ ), they cannot work in continuous duty (S1). Even the motors of the BAH series are available in the EP version, starting from size 80.
The brake assembly of the $\mathrm{BA}, \mathrm{BM}, \mathrm{BAH}$ motors in the EP version remains the same as that used on the corresponding type of motor for continuous duty (BAX, BMX, BAHX series).

The motors of the BA - BM 'Enhanced Power' series, as an alternative to the 60\% S3 intermittent duty, can work (and consequently be stated on te nameplate) for short-term duty S 2 as indicated in the table below.

| Frame size | Duty |
| :--- | :--- |
| $56-63$ | S 230 min |
| $71-80$ | S 240 min |
| 90 | S 250 min |
| $100-112$ | S 260 min |
| 132 | S 270 min |
| $160-180-200$ | S 290 min |
| 225 | S 2120 min |
| $250-280$ | S 2150 min |

## traverse motors with progressive start and stop

A few problems such as the swinging of suspended loads, slipping of trolley wheel on rails, the breakage of some delicate mechanisms can occur on traverse applications. All these problems can be solved using progressive start/stop systems such as clutches, hydraulic couplings, slip-ring motors or soft start devices. Experience has shown that progressive start/stop PV brake motor is a valid alternative to all the other adducted systems. Traverse motors are provided with a flywheel whose dimension and weight are calculated in order to have an adequate moment of inertia. The ratio of rated torque to starting (locked rotor) torque is calculated in order to achieve the best progressive performance.
The flywheel accumulates energy during the start and gives it back during the stop resulting in a progressive change of the rotating speed. PV series motors don't need adjustments with load change or any special maintenance and the progressive action is directly proportional to the load increase. During the planning stage it is necessary to choose carefully the proper motor power as an insufficient power could cause overheating while a too powerful motor could reduce the effect of the flywheel progression.
The flywheel doesn't cause any problems in case of start/stop in rapid succession (positioning of loads) but not for a long period of time in order to avoid overheating. The presence of a special rotor P allows to obtain reduced starting current ( $\mathrm{I}_{\mathrm{s}}$ ). BAPV series motors provide a reduced brake torque, resulting in a really progressive action. The brake torque of BAPV motors is about the half of the corresponding BA standard brake motors while BM and BMPV series motors have the same brake torque.
The progressive start/stop of a BAPV motor is obtained by a flywheel strongly secured to the motors shaft in the place of the normal brake disc of the BA series while in a BMPV motor this progression is obtained by means of a cast iron cooling fan which replaces the thermoplastic one.

PV series motors are available with the following features or option:

- separate brake supply
- manual brake release
- suitable for mounting in any position (vertical, horizontal, etc.)
- two speeds

The table below shows the moment of inertia increase ( $\mathrm{Kgm}^{2}$ ) for BAPV and BMPV series.

| Motor Type | 63 | 71 | 80 | 90 | 100 | 112 | 132 | 160 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| BAPV | - | $2.97 \cdot 10^{-3}$ | $6.78 \cdot 10^{-3}$ | $1.11 \cdot 10^{-2}$ | $1.82 \cdot 10^{-2}$ | $2.89 \cdot 10^{-2}$ | $5.8 \cdot 10^{-2}$ | $14.3 \cdot 10^{-2}$ |
| BMPV | $3.1 \cdot 10^{-4}$ | $1.93 \cdot 10^{-3}$ | $3.12 \cdot 10^{-3}$ | $9.97 \cdot 10^{-3}$ | $1.52 \cdot 10^{-2}$ | $1.52 \cdot 10^{-2}$ | - | - |

The total moment of inertia of a chosen motor is the moment of inertia of a standard brake motor (see motors technical data) plus the flywheel moment of inertia (shown in table above).

Example:
moment of inertia of BAPV $71 \mathrm{~B} 4=$ moment of inertia of BA $71 \mathrm{~B} 4+$ flywheel type BAPV 71 B 4 moment of inertia $=8.1 \cdot 10^{-4}$ $+2.97 \cdot 10^{-3}=3.78 \cdot 10^{-3} \mathrm{Kgm}^{2}$

The table below shows the maximum brake torque (Nm) for BMPV with DC brake and BAPV motors with AC brake or DC brake:

| Motor type | $\mathbf{6 3}$ | 71 | $\mathbf{8 0}$ | $\mathbf{9 0}$ | $\mathbf{1 0 0}$ | $\mathbf{1 1 2}$ | 132 | $\mathbf{1 6 0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| BMPV | 5 | 5 | 10 | 20 | 40 | 60 | - | - |
| BAPV - A.C. | - | 7 | 9 | 19 | 25 | 40 | 75 | 95 |
| BAPV - D.C. | - | 4.5 | 7.5 | 15 | 21 | 30 | 60 | 77 |

BMPV series

BAH Series $80 \div 315$
BA brake motors are supplied as standard as BAH series starting from the frame size 225 up to 315 mm and on request starting from the frame size 80 up to 200. In the technical data tables the BAH series motors are proposed in the BAHX version for continuous duty with efficiency class IE2 / IE3 (compliant with EU regulation 2019/1781), alternatively they can be supplied in the BAH 'Enhanced Power' version only for intermittent service (S3 60\%).

The BAH serie-motors have the same characteristics of the BA-BAX serie-motors. The difference essentially consists in the casing of the brake assembly designed to give greater strenght and protection against the entry of dust and liquids (IP degree). The BAH serie-motors are supplied as standard with IP55 protection degree and, on request, with IP56-65-66 protection degree.

17 - Brake Friction surface
18 - Spring
19 - Brake Adjuster
20 - Brake Torque Adjuster Locknut
21 - Air Gap Adjusting Nut
22 - Brake Coil Locknut
23 - Brake disc
24 - Brake Moving Element
25 - Brake coil
26 - Brake Cover (BAH)
60 - Air Gap
117 - Brake Cover Fixing Screw (BAH 80 $\div 112$ )
119 - Brake Cover Closing Cap BAH
125 - Brake Cover Fixing Nut (BAH 132 $\div 315$ )
Starting from frame size 160 casing, shields, flanges, brake friction surface and the brake protective cover are made of cast iron in order to provide a greater mechanical strenght and to be suitable for harsh environment (i.e. marine application). Upon request, starting from frame size 225, the motor body can be made of ductile cast iron.

Starting from frame size 160 shafts are made of 39NiCrM03 steel.
The standard brake release is the locking type (on request it's possible to have the unlocking one).

The locking type brake release is realized by means of 1 central screw for sizes $80 \div 112$, 2 side screws for sizes 132ㄴ315.

The following options are available upon request:

- special shaft dimensions (DE-side) or double extended shaft (NDE-side);
- encoder;
- brake release system (unlocking type);
- anti-condensation heaters on the motors and/or on brake coils;
- thermistors (PTC) or Bi-Metallic (PTO) thermal protectors;
- non-ventilated execution (BAHS).

a vowll|l

$160 \div 280$ B3

Double terminal board box

BAPK series brake motors are available starting from 100 up to 225 frame size. Powers and poles are the same as the BA series motors (see BA technical data). BAPK series motors have the same motor construction as BA series motors but present some special parts. Single and most of the two speed BAPK motors are fitted with a special rotor (P rotor) that increases the starting torque (locked rotor) by 20\% about and that reduces the starting current (locked rotor) by 10\% about.
The brake assembly of a BAPK motors is just the same of the standard BA series with 2 braking surfaces but with a special brake disc (K) with steel hub. The BAPK series motors are equipped as standard with an AC brake.
Feet are frame integrated on B3 mounting (foot mounted) and not simply attached to the frame. This feature guarantee best reliability of brake motors for hoist application. Shields and flanges are made of cast iron. Frame is made of aluminium from 100 up to 132 frame size (132 cast iron frame is available on request) while it is made of cast iron starting from 160 frame size. Dimensions are the same as the BA series (dimensions sheet pag. 39). To purchase BAPK series motors the writing BAPK has to be clearly stated in the order (i.e. BAPK 112MB4).

## K brake disc

The K brake disc is provided as standard on motors starting from 160 frame size while it's available on request on motors from 90 up to 132 frame size. As for the case of the BA standard brake, which is made of a special aluminium/thermoplastic material, the K brake disc has two friction surfaces and it has a nucleus and a steel hub, which guarantee a higher sturdiness and moment of inertia. K brake disc is strongly recommended for hoisting application, safety application or under high environment temperature ( $50^{\circ} \mathrm{C}$ or above).
K brake disc has a shorter life than the standard brake disc as a consequence of the increased moment of inertia therefore it's advisable to use the standard brake disc on heavy start/stop duty cycle application where the K disc is not necessary. To purchase motors with K brake disc, the writing BAK has to be clearly stated in the order (i.e. BAK 112 MB4). For further information please contact MGM.

## premium brake torque motors - BAF series

BAF series motors are brake motors providing a very high brake torque. BAF series motors are particularly suitable for those applications where it's needed to keep the motor locked up also under a very high turning moment. The required high value of static brake torque is achieved by the use of a double brake disc (BAF series). BAF series motors are provided with AC brake. BAF motors are available starting from 100 up to 200 frame size. The table below shows the BAF series brake torque values ( $50 \%$ more than standard BA series).

| Motor type | BAF 100 | BAF 112 | BAF 132 | BAF 160 | BAF 180 | BAF 200 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Brake Torque Max (Nm) | 75 | 120 | 225 | 285 | 450 | 450 |

AC electric motors operating in non standard conditions (low frequency inverter duty, long overcharge periods, heavy duty cycles) could need additional cooling servo-fan. BASV series motors with forced cooling are provided with two additional cooling servo-fans fixed on the motor frame.

This cooling system (MGM patent), compared to the traditional solution, has the following features:

1. The standard self cooling fan inside the motor is kept additionally to the cooling servo-fans.
2. The whole heating surface is increased as the fan fixing system is itself a heat dissipation element additional to the existing fins on the frame.
3. Low noise level.
4. No additional motor length compared to the standard one.
5. Manual brake release with manual rotation.
6. Uniform winding cooling along the whole motor length.
7. The brake friction surface is cooled on the motor side.

Where the forced cooling is used to limit the operating temperature in heavy start/stop duty application, it should be noted that the efficiency of the forced cooling increases with the number of poles of the motor. It's hard to estimate the amount of hot air removed by the forced cooling fans but it can be roughly said that it is the same as the air removed by the standard servo-fan of a 4 pole motor operating at 50 Hz .
It is advisable to use thermal protectors in heavy operating conditions. The table below shows the technical details of fans supplied at 1~230V single-phase and 400 three-phase. The servo-fans can be supplied both at 50 Hz or 60 Hz . On request forced cooling fans can be provided with different voltage supply.

It is also possible to have the motors of the BM series in the BMAV version with axial ventilation (axial servo-fan located in the rear part of the motor, replacing the standard motor fan).

| Motor type | Dim Q $\mathbf{( m m )}$ | Volt | Watt |
| :--- | :---: | :---: | :---: |
|  |  |  |  |
| BMAV 56 | 250 | $1 \sim 230$ | 16 |
| BMAV 63 | 280 | $1 \sim 230$ | 16 |
| BMAV 71 | 315 | $1 \sim 230$ | 16 |
| BMAV 80 | 364 | $1 \sim 230$ | 16 |

| BMAV 112 | 465 | $1 \sim 230$ | 36 |
| BMAV 132 | 604 | $3 \sim 400$ | 93 |
| BMAV 160 | 734 | $3 \sim 400$ | 93 |
| BMAV 180 | 825 | $3 \sim 400$ | 123 |
| BMAV 200 | 825 | $3 \sim 400$ | 123 |
| BMAV 225 | 1065 | $3 \sim 400$ | 123 |

BMAV Series

The motor with built-in encoder is supplied as standard with a separate brake power supply from that of the motor. The letter E after the series indicates that the motor is supplied complete with encoder, the letters SV and AV indicate the presence of auxiliary ventilation radial (SV) or axial (AV), the letter H indicates the casing of the brake unit with a higher IP degree of protection. The following series are available:

BAE series: asynchronous three phase fan cooled brake motors with built-in encoder and frame size from 71 up to 315 . The encoder is located at the Non-Drive end (NDE side) in a safe place protected by a well closed cover. Forced (radial) ventilation is available on request (BAESV).The motors are also available in the BAH version (BAHE, BAHESV). The brake hand release is not availalble for BAE series while is avalable on request for BAHEBAHESV series motors.

BMEAV series: asynchronous three phase brake motors with DC brake with axial forced ventilation, built-in encoder and frame size from 63 up to 225. The encoder is located at the NDE side between the brake coil and the servo fan. On request it is also available in the self-cooled version (BME) without forced ventilation. The motors are supplied on request with a manual brake release lever.

Motors with built in encoder (BAE, BAESV, BAHE BAHESV, BMEAV, BME series) are designed to be suitable for inverter use; precise dynamic balancing along with an accurate motor insulation system are adopted in order to withstand the greater electrical and mechanical stress. The mechanical coupling is the same of a standard motors (special shaft and flange are available on request), wirings are very simple to be made: power and electrical signal duty are separated. Upon request, the motors can be supplied with the cCSAus approval.

The motors are available in BAX (BAXE, BAXESV, BAHXE, BAHXESV) and BMX (BMXEAV, BMXE) versions for continuous duty and efficiency class IE2 / IE3 (compliant with European regulation EU 2019/1781).

## Encoder

To identify exactly the needed encoder, the following characteristics have to be indicated:

- Encoder type (incremental or absolute)
- Resolution (PPR)
- Zero pulse
- Encoder supply voltage
- Electronic output configuration
- IP protection degree (please consider that for the BAE series the encoder is also protected by a well closed cover)
- Interface type
- Code (only for absolute encoders)
- Single turn or Multi turn (only for absolute encoders)

The output cable is provided as standard without connector (floating cable). On request a connector can be supplied.

BMEAV series

Shaft End

Please contact MGM for further information regarding the dimensions of the motors series BMEAV with 180-200-225 frame size or the dimensions of the motors series $\mathrm{BM}(\mathrm{X}) \mathrm{E}$.

## R series

The " $R$ " Series is made up of a new generation of asynchronous standard motors (SMR) or brake motors (BAR or BMR), 4 and 6 poles and IEC frame sizes from 56 up to 132. Available nominal torques range is from 0.4 Nm to 37 Nm on 4 pole motors while it's from 3.88 Nm to 54.71 Nm on 6 pole motors. $\mathbf{R}$ series motor is designed to be controlled by inverter only. The reference frequency at a voltage of 400 V is 120 Hz instead of 400 V 50 Hz . The special technology allows to the R series motors to have the following features:

- constant torque from 3 to 120 Hz
- torque close to the nominal one at 0 rpm (only in a closed loop vector system)
- Higher Power Density (same power in smaller motor sizes)
- reduced moment of inertia compared to a motor with same power (high dynamics)
- faster acceleration and deceleration times
- excellent behaviour during transients (4 poles) and in continuous duty (6 poles)
- optimized for use with different types of inverters in the market
- balancing suited for operation with high acceleration
- standard motor sizes and mounting
- low noise
- standard electrical wiring
- encoder option available
- user friendly product (connectors not needed)

On standard, R series motors are equipped with thermal protectors, rotor and stator magnetic steel with advanced magnetic properties, motor winding specifically designed and impregnated for operation at high frequency, higher grade rotor balancing and bearings resistant to high rotation speed. All the options of standard motors series are also available for the R Series
IP54 enclosure rating is factory standard for brake motors while IP55 for standard motors. Enclosure rating up to IP56 is available on request. All motors can be provided either with an encoder or encoder ready.

## Low moment of inertia (at equal power)

Thanks to the diameter of the bottom rotor, the reduction in the moment of inertia for a motor in the new series "R" is very significant compared to one with equal power and traditional polarity. This means lower energy demand during transients and definite improvement in the dynamic qualities. The examples below show a comparison in the moment of inertia for two motors:

- standard motor (without brake) $0.75 \mathrm{~kW}(S M 80 \mathrm{B4}) 12.39 \times 10^{-4} \mathrm{Kgm}^{2} \quad$ - brake motor standard version 2.2 kW (BA 100 LA 4$) 51.14 \times 10^{-4} \mathrm{Kgm}^{2}$
- "R" series motor (without brake) $0.72 \mathrm{~kW}\left(S M R 63\right.$ D4) $3.68 \times 10^{-4} \mathrm{Kgm}^{2} \quad$ - "R" series brake motor 2.16 kW (BAR 80 D 4 ) $18.3 \times 10^{-4} \mathrm{Kgm}^{2}$

| Constant torque |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| The torque remains constant at the nominal value and from a few Hz up to 120 Hz . Once over 120 Hz , the motor delivers constant power up to 3600 for 4 poles and 2400 for 6 poles. <br> The torque value with locked rotor can reach about $100 \%$ of the nominal torque. The greater extension of the speed adjustment field in which the motor retains the capacity to provide constant torque, allows a better control of the motor and machine on which it is applied. |  |  |  |  |  |  |  |  |  |

## Application

The sectors where they are most used are in automation and packaging (ceramics, conveyor belts, automatic warehouses, etc.). The typical applications are primarily concentrated on machines that use both asynchronous motors driven by inverters and brushless ones, especially in intermittent duty. In the first case (replacement of asynchronous motors), they are indicated in all those applications in which the increase in speed leads to an operation at a frequency that is higher than the basic frequency of the motor with a subsequent decrease in torque. Specifically, the application of these motors allows to keep the gear box reduction ratio unchanged while increasing the frequency without problems. Motors in the "R" series offer more adjustment possibilities (wider frequency range), better dynamic characteristics, similar or less energy consumption with smaller motor size and weight at equal power. Using this product instead of an asynchronous motor makes an increase in transmission ratio necessary if you wish to decrease the size of the motor at equal power. The reduction in size and weight at same power is very evident: this translates into a savings for the customer about the cost of the power transmission (as motor unit + gearbox) and the cost of the machine structure. Using these motors makes also possible to rise the lower motor frequency, moving to a speed range that doesn't need a forced cooling system (an appropriate reduction ratio must be chosen). To maximize the advantages, we recommend using a reduction gear unit rather than a worm gearbox. Replacing brushless motors: these are a valid alternative to servo motors in all applications in which a very strong dynamic is not required and in which a strict interpolation between the two motors is not needed. Compared to a brushless motor, the advantages are a reduction in cost, the absence of dedicated cables and connectors, a reduced maintenance and an extremely simple use that does not require specialized staff.
Definitively this new product allows:

- to think in a new way the process regarding the machine motorization
- to use an asynchronous motor instead of a brushless one
- to have smaller and lighter machines than current ones with equal power
- to have greater speed adjustment intervals
- to have an increased efficiency
- to have a reduced inertia at equal power
- to have a product that is simpler to use
- to have the same accessories as the standard product (encoder, power ventilation, etc.)
- to use any type of commercial inverter in the market
- to eliminate forced ventilation in many cases.

Many industrial sectors have standardized certain types and brands of inverters. "R" series motors were designed and optimized to be extremely versatile and able to maintain the same performance with all major commercial drives This feature means not changing its standard and being able to use the most suitable inverter.

## Motors for wind generators

Brake motors are used in wind generators to rotate the nacelle according to the wind direction (Yaw) and to position the blades based on the wind direction and its intensity (Pitch).
MGM brake motors have been widely used in this sector for years. This type of application requires high reliability, low maintenance and the possibility of an use in special environments (low temperatures, sandy environments, offshore installations).
For this reason, the motors for this application keep certain features that are common to all motors in the BA and BM series and also specific variants, and that can vary depending upon the type of the wind power plant:

- Suitability for operation with inverter
- Various voltage supplies available for both, motor and brake
- Motor power supply separated from the brake ones
- Low moment of inertia
- Possibility to customize the torque curve as need with limitation of the maximum torque
- Protection rating IP54, IP55, IP56, and IP66
- Possibility of installing bi-metallic thermal protectors (PTO) and thermistors (PTC)
- Encoder mounting (upon request)
- Completely closed brake construction (upon request)
- Availability of brake coils with AC or DC supply (built-in rectifier)
- Possibility of installing microswitches upon request to detect the brake release
- Air gap adjustable in an easy way and continuosly
- Braking torque adjustable in an easy way and continuosly
- Execution for inspection (measurement) of the braking torque (upon request)
- Suitable braking unit to support prolonged slips and at high speed (upon request)
- Low wear of the brake disc linings
- Braking torque stability
- Quick brake intervention
- Locking or non-locking brake release
- Possibility of installing anti-condensation heaters on the motor and on the brake
- Execution for operation for low temperatures $\left(-40^{\circ} \mathrm{C}\right)$ available upon request
- Anti-corrosion treatment (upon request)
- Paint depending on the type of installation (for example cycle C5M-H for offshore installations)
- cCSAus certification (upon request)

For the best definition of the type of motor and related variants, we recommend contacting the MGM technical department.

## Motors for automatic industrial doors

BM series motors with certain specific variants are widely used in the industrial door sector. Here below some of the features usually requested for this application:

- Manual brake release with automatic return (non-locking)
- Double output shaft ready for the manual door opening system
- Anti sticking system for the brake disc
- Safety microswitch for manual manoeuvres
- Reduced brake response time
- IP55 protection degree
- Silent execution
- Thermal protectors
- Wide terminal board box
- cCSAus or CCC certification

For the best definition of the type of motor and related variants, we recommend to contact MGM organization.

## BMBM series

BMBM series motors are designed for intermittent duty S3 25\% (see technical data). BMBMX series motors for intermittent duty S3 40\% are also available. Consist of asynchronous three phase brake motors with twin DC brakes working independently of each other, starting from 63 up to 315 frame sizes and power range from 0.08 kW up to 132 kW . BMBM series main feature is a very high reliability in those lifting applications where there are high demands of safety and silence. For these reasons BMBM series motors are particularly suitable to be used in TV-cine studios and theatre stages.
The motor brakes in case of power supply failure. The braking action is always secured through a very quick and precise stop assuring a safe and a prompt stop in case of unintentional power supply failure. The brake torque remains the same in both directions of rotation and the braking action occurs without shaft axial sliding. The brake components and assembly are designed with special features to be noiseless during stops. The manual brake release is made up of two levers (one for each brake) so to avoid unwanted starts. It's possible to release the brakes just using one hand.
The two brakes are supplied through independent rectifiers which are positioned in the terminal box. Rectifiers are provided with over-voltage protection device. It's possible to have two types of wirings connection to the rectifier for each brake, in relation to the intervention time required. All BMBM series motors can be driven by inverters. On request, it's possible to have the motor with a built-in encoder or to have the motor ready for the encoder to be easily fitted at customer's place. The brake disc friction material is asbestos free and the brake lining has a high friction factor and is long-lasting. The standard winding insulation class is F . Class H is available upon request. Motor construction type is Totally Enclosed Not Ventilated (TENV) with IP 54 enclosure rating (IP 55 and external cooling are available upon request). BMBM series motors tolerate a high overload level and being not self-cooled have to be used on intermittent duty only.
On request it's possible to provide motors with thermal protection devices (PTO or PTC or KTY), microswitch for brake monitoring (ON/OFF or WEAR function), special double shaft end according to customer design, different types of encoders, different brakes voltage.
Frame is made of die cast aluminium on motors up to 132 frame size and of cast iron on motors from 160 up to 315 frame size. Feet are frame integrated (they are not simply attached to the frame) on IM B3 mounting (foot mounted) and it makes the motor very sturdy since this motors are used in critical applications. Shields and flanges are made of aluminium up to 90 frame size and of cast iron for above sizes.

| Frame size (mm) | Standard drake torque (Nm) | Power consumplion (W) |
| :---: | :---: | :---: |
| 63 | $2 \times 3.5$ | $2 \times 22$ |
| 71 | $2 \times 3.5$ | $2 \times 22$ |
| 80 | $2 \times 7.0$ | $2 \times 28$ |
| 90 | $2 \times 14$ | $2 \times 34$ |
| 100 | $2 \times 28$ | $2 \times 42$ |
| 112 | $2 \times 42$ | $2 \times 50$ |
| 132 | $2 \times 70$ | $2 \times 64$ |
| 160 | $2 \times 107$ | $2 \times 76$ |
| 180 | $2 \times 150$ | $2 \times 100$ |
| 200 | $2 \times 250$ | $2 \times 140$ |
| 225 | $2 \times 375$ | $2 \times 140$ |
| 250 | $2 \times 800$ | $2 \times 144$ |
| 280 | $2 \times 800$ | $2 \times 144$ |
| 315 | $2 \times 1000$ | $2 \times 144$ |

Different brake torques for each of the frame sizes stated here above are available on request. Please contact MGM organization for more information.

BMBM B3

BMBM 160M/L-180L-200 B3

Shaft End

Please contact MGM for further information regarding the dimensions of the motors series BMBM with 225-250-280-315 frame sizes.

Upon request $\mathrm{BA}, \mathrm{BAX}, \mathrm{BM}, \mathrm{BMX}$ brake motors and derivative series can be provided with cCSAus approval (complying with CSA C22.2 No. 100 and UL 1004-1 standards). Only cCSAus approved motors show the relevant marking on the nameplate.

It's possible to download the CSA certificate from our website (www.mgmrestop.com) under the section DOCUMENTATION $\rightarrow$ QUALITY.

Motor sold in USA and in Canada must also comply with the energy efficiency regulation. Single speed, asynchronous motors with and without brake, with power greater than 0.75 kW (from 1 HP up to 500 HP ) and rated for continuous operations are covered by the USA and Canada energy efficiency regulation and need to meet Premium efficiency levels (equivalent to IE3).
Some motors including double speed and intermittent duty motors (S2 $\div$ S10) are excluded by the Canadian and American regulations.

MGM brake motors series BAX and BMX with 2, 4, 6 poles and powers from 0.75 kW up to 45 kW (1HP to 60HP) comply with this regulation. Motors complying with the North American efficiency regulation show the "Certification Compliance Number" (CC number) issued by the US Department of Energy (DOE) and the cCSAus "Energy Verified" mark on the nameplate according to the Canadian regulations. The certification covers various options including thermal protectors and thermistors, space heaters, encoders, etc. Please contact MGM for more information on the available certified options.

For those motors intended for intermittent duty ( $\mathrm{S} 2 \div \mathrm{S} 10$ ) and therefore not covered by the efficiency regulation, the brake motors belonging to the BA and BM series can be supplied. In this case on the name plate will be stated the intermittent duty and just the cCSAus logo (but not the CC number and the "Energy Verified" indication).

The MGM laboratory is certified by CSA (ISO 17025) to perform safety tests required for the cCSAus certification as well as the efficiency tests to determine the motor efficiency. It's possible to download these certificates from our website (www.mgmrestop.com) under the section DOCUMENTATION $\rightarrow$ QUALITY.

MGM motors can be provided with two different winding configurations: $\Delta / Y$ (Delta/Star) 6 wires European standard or Y/YY (Wye/double Wye) 9 wires American standard, 3ph 230/460V 60Hz.

Motors with NEMA flanges and shafts are available on request (see page 9).
In the purchase order it's always necessary to specify the following information to MGM:

- cCSAus certification.
- The required duty (Continuous or Intermittent) in case of single speed motors;
- The motor and brake coil voltage.

SMX series are non-brake 3-phase asynchronous motors with 2, 4, 6 poles and powers from 0.75 kW (1HP) up to 45 kW (60HP) and comply with the cCSAus standards and energy efficiency regulation. SMX motors series bear the "Certification Compliance Number" along with cCSAus 'Energy Verified' mark on the nameplate.

Dimensions are in inch ( 1 inch $=25.4 \mathrm{~mm}$ ).
For the dimenions of the IEC motors refer to page 38 for BA-BAX series and to page 49 for BM-BMX series.

BIS certification (Indian standard IS 12615: 2018) is mandatory in India for both standard motors (without brake) and brake motors.

Certified motors stated the ISI marking on the nameplate.
MGM has certified BAX and BMX series brake motors and SMX series motors (standard motors without brake) with a power between 0.12 kw and 55 kw with 2,4 and 6 poles. The tables below show the motors of the BAX and BMX and SMX series that can be supplied and their relative certification (BIS only or both CE and BIS), based on the required efficiency class.

When ordering it is necessary to specify 'Certification for India' in addition to the characteristics of the motor and the required efficiency class.

For the $2,4,6$ pole motors listed above, they can also be supplied with accessories such as encoders, servo-ventilation, PTC, PTO, heaters, Microswitches, K disc, flywheel, double brake disc. The motors are available with protection degree from IP54 to IP66 and with AC or DC brake. Contact MGM for more information on the available range.

## China

Both standard (without brake) and brake motors for China must comply with two requirements: CCC marking (safety aspects) and minimum efficiency class:

- CCC marking: applies to motors with power $\mathrm{P} \leq 2.2$ kw (2-pole),
$P \leq 1.1 \mathrm{kw}$ (4-pole), $\mathrm{P} \leq 0.75 \mathrm{kw}$ ( 6 pole), $\mathrm{P} \leq 0.55 \mathrm{kw}$ (8 pole).
- Efficiency class (CHINA ENERGY LABEL): applies to single speed motors with power $\mathrm{P} \geq 0.12 \mathrm{kw}$ and the minimum efficiency class required is IE3 (corresponding to grade 3 required by the Chinese standard), furthermore those with $P \geq 0.75$ kw must have the specific CEL label (China Energy Label).

The following are the standard and brake MGM motors that can be supplied (with CCC, CCC and CEL, CEL only). All motors also states the CE marking on the motor nameplate.

(*) According to the relevant standard, the efficiency classification starts from 0.12 kW power, therefore the motors marked with an asterisk they $^{*}$ have no indicator on the nameplate of the efficiency class.

Available options / variants:

- B3 footmounting, B5 or B14 flange.
- Double shaft, special shafts dimensions, shafts or flanges according to NEMA standard
- AC and DC brake
- Protection degree IP54 or IP55
- Simple or double terminal block
- Side terminal box
- Hand brake release (BM Series)

To order a motor that complies with the above requirements for China, it is necessary to specify 'China Certification' when ordering.

## Contact MGM for more information.

## Russia, Belarus, Kazakhstan, Kyugzstan, Armenia

On request motors with EAC marking can be supplied for the countries of the Eurasian Customs Union (Russia, Belarus, Kazakhstan, Kyrgyzstan, Armenia).

To order motors with this marking it is necessary to specify when ordering 'EAC marking'.

Contact MGM for more information.

## Australia and New Zealand

The GEMS (Greenhouse and Energy Minimum Standards) regulation in force in Australia and New Zealand establishes the minimum efficiency values of asynchronous three-phase motors, single speed, 2,4,6,8 poles with rating power from 0.73 kW to 185 kW . They are excluded from the application of this regulation some types of motors (for example two-speed motors or S 2 duty motors).
For more information MGM.

In various countries of the world in addition to those already mentioned (Europe, USA, Canada, India, China, Australia and New Zealand) there are specific regulations on the minimum efficiency of the motors. These regulations differ in scope, efficiency limit values, exclusions, labeling or mandatotory registrations. Furthermore, these regulations are periodically updated with even substantial changes. They are in effect only by way of example of the regulations on the minimum efficiency of motors in Korea, Japan, Saudi Arabia, Mexico, Brazil, Colombia, etc. It is therefore recommended when defining a new order to verify the presence of these regulations in the country concerned and to contact us for further information.

## Regovery/disposal

The motor must be disposed in compliance with the regulations in force in the country of installation.
 The crossed-out bin symbol, shown on the nameplate, indicates that the product, at the end of its useful life, must not be disposed as mixed urban waste but must be collected separately from other waste and sent for recovery or possible disposal according to specific methods to avoid possible negative effects on the environment and heath and to encourage the reuse and / or recycling of materials of which the motor is composed.

Most of the motors components are made with materials (steel, copper, aluminium, etc.) that can be reused / recycled thus contributing to the protection of the environment.

Here is, as general indication, some information on the various materials of the motor components:
aluminium (e.g .: frame 56-132, flanges B5/B14 and shields B356-90, Endshield Brake Side BA 71-112, Endshield Brake Side BM 56-80, double terminal box and cover (63-180);
steel and cast iron (e.g .: 160-315 frame, Brake Friction Surface, moving element, B5 / B14 flange and B3 100-315 shields, Endshield Brake Side BA 132-315, Endshield Brake Side BM 90-225, double terminal box and cover 200-315, motor shaft, key, stator, fan cover, brake cover, encoder protection cover, bearings, screws and tie rods, BA brake release screw, brake springs, brake adjusters, brake coil core, Stainless steel plate, Hexagonal Rear Nut BA 132-315);
copper (eg: stator winding and electromagnet winding);
paper and cardboard (eg: packaging box, user and maintenance manual);
plastic and rubber (ex: cable gland, 0-rings, fan, terminal box gaskets, single terminal box cover 63-90, Hexagonal Rear Nut BA 71-112); electronic components (eg: rectifier, RC filter, encoder);

For more information on disposal/recovery methods or specific information on the motor components materials visit our website (www.mgmrestop.com) or contact MGM.

MGM motors from 56 up to 315 frame size are individually packed in a box which externally reports the motor identification data (motor code, motor code barcode, motor description, motor serial number). The table below shows the boxes dimensions for each size. Motors with frame size 160 up to 225 are fixed down to pallets with squared timbers. Pallets have EURO overall dimensions ( $120 \times 80 \mathrm{~cm}$ ). Additional protective materials as cardboard and shrink film around the pallet are used for sea and air shipments.

| Motor size | Depth (cmi) | Witth (cm) | Height (mm) |
| :---: | :---: | :---: | :---: |
| Brake motor frame size 56 mm | 38 | 19 | 22 |
| Brake motor frame size 63 mm | 38 | 19 | 22 |
| Brake motor frame size 71 mm | 38 | 19 | 22 |
| Brake motor frame size 80 mm | 49 | 23 | 27 |
| Brake motor frame size 90 mm | 49 | 23 | 27 |
| Brake motor frame size 100 mm | 54 | 29 | 35 |
| Brake motor frame size 112 mm | 54 | 29 | 35 |
| Brake motor frame size 132 mm | 69 | 35 | 42 |
| Brake motor frame size 160 mm* | 93 | 63 | 52 |
| Brake motor frame size 180 mm * | 93 | 63 | 52 |
| Brake motor frame size 200 mm* | 93 | 63 | 52 |
| Brake motor frame size 225 mm | 120 | 80 | 70 |
| Brake motor frame size 250-280 mm | 135 | 80 | 80 |

BAF-BAPV 71 series-motors are packed into boxes with a dimension of $49 \times 23 \times 27 \mathrm{~cm}$.
Motors highlighted with * can be delivered either inside a box or fixed on the pallet.
On request for a high quantity batch of the same motor size it's possible to pack the motors directly in a single big box (MULTIPACK). Motors are arranged in carton layers in order to protect goods integrity. The drawing here below shows the box overall dimension while the chart shows the batch quantity that can be inserted in each MULTIPACK box according to the frame size.
The stated quantity has to be considered an approximate quantity as it changes with the required motor mounting ( $\mathrm{B} 3, \mathrm{~B} 5, \mathrm{~B} 14$ etc.).

| Frame Size | Quantity |
| :---: | :---: |
| $56-63$ | 80 |
| 71 | 40 |
| 80 | 30 |
| 90 | 20 |

## Terms and Conditions of Sale and warranty

All goods manufactured or supplied by MGM motori elettrici SpA shall be subject to MGM terms and conditions of sale and warranty listed on the MGM internet site www.mgmrestop.com

The table below shows the available main special features and the options for MGM motors. Letter S stands for "Standard", letter R stands for "on Request" and letter N stands for "unavailable".

| Ref. | Descripition |  | BM | BA |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Non-standard flange |  | R | R |
| 2 | Special motor shaft as per drawing |  | R | R |
| 3 | Motors with feet and flange (IM B35 and IM B34 with corresponding vertical mounting) |  | R | R |
| 4 | Balancing for reduced or special vibration level |  | R | R |
| 5 | Separate brake supply (two different terminal boards) | 1 | R | R |
| 6 | IP 55 or IP 56 Enclosure rating (protection degree) |  | R | R |
| 7 | Special motor/brake voltage or frequency supply |  | R | R |
| 8 | Motor Insulation Class H |  | R | R |
| 9 | Brake torque and/or air gap pre-adjustment to desired value |  | R | R |
| 10 |  |  | R | R |
| 11 | CCC marking @c) and/or China Energy Label (CEL) |  | R | R |
| 12 | EAC marking ER[ |  | R | R |
| 13 | BIS marking |  | R | R |
| 14 | Standstill heating |  | R | R |
| 15 | Bimetallic thermal protectors PTO or Thermistors PTC |  | R | R |
| 16 | Tropicalization treatment of motor windings |  | R | R |
| 17 | Over-voltage safety cutout (RC04 and RC10) |  | R | R |
| 18 | Terminal box on the right (left) side for IM B3 (BA 80-132) |  | $N$ | R |
| 19 | Double shaft end | 2 | R | R |
| 20 | Test certificate |  | R | R |
| 21 | Rain roof (BM), special fan cover for outside vertical mounting |  | R | N |
| 22 | Brake cover (BA), special brake cover for outside vertical mounting |  | N | R |
| 23 | Precise tolerance class |  | R | R |
| 24 | Fan cover for textile environment | (4) | R | S |
| 25 | Motor with built-in encoder or tachogenerator | 2 | R | R |
| 26 | Motor arranged for manual rotation (shaft fitted with hexagonal hole at non-drive end) | (3) | S | S |
| 27 | Special finishing (marine environment, washdown applications) |  | R | R |
| 28 | Manual brake release screws | 2 | N | S |
| 29 | Manual return brake release lever |  | R | R |
| 30 | T key for manual shaft rotation |  | R | R |
| 31 | Stainless steel tie rods, bolts, nuts and screws |  | R | R |
| 32 | Forced cooling motor (SV, AV series) |  | R | R |
| 33 | Motor with additional cable gland holes |  | R | R |
| 34 | Drain holes |  | R | R |
| 35 | Stainless steel friction surface |  | R | R |
| 36 | Brake release microswitch or inductive sensor |  | R | R |
| 37 | Inductive sensor or microswitch detector of the brake disc wear |  | R | R |

1
Double terminal board box for brake separate supply is provided as standard on BM and BA two speed motors while it's on request only on single speed motors.

## 2

Brake manual release screw is not provided as standard on BA motors with double shaft end or with encoder or techogenerator.
(3)

Motor with frame size up to 132 are fitted as standard with hexagonal hole at Non-Drive end. The hexagonal hole is available on request on motors with frame size 160 and above.
4
BA series motors don't need the fan cover for textile environment.

## spare parts

To clearly identify a spare part it's necessary to provide the item number (shown on the drawing below), the motor type, the rated voltage and frequency supply for electric parts such as the stator, the brake coil and the rectifier.

## spare parts

To clearly identify a spare part it's necessary to provide the item number (shown on the drawing below), the motor type, the rated voltage and frequency supply for electric parts such as the stator, the brake coil and the rectifier.

| 1 | Rotor | 25 | Brake coil |
| :--- | :--- | :--- | :--- | :--- |
| 2 | Key | 26 | Brake cover (BAH) |
| 3 | Front bearing | 28 | Hexagonal rear nut |
| 4 | Front cover (B3) | 29 | Terminal board box screws |
| 6 | Tie rod assembly | 30 | Terminal board box (single or double) |
| 7 | Frame | 32 | Terminal board |
| 8 | Circlip | 34 | Cable gland |
| 9 | Rear cover | 36 | Terminal box/brake coil connection |
| 11 | Fan | 37 | Flange cover (B5) |
| 12 | Fan assembly | 38 | Flange cover (B14) |
| 15 | Rear bearing | 49 | Elastic washer |

Flywheel BMPV (not represented 91 represented on the drawing)

Manual brake lever kit 92 (on request)

Brake protective ring 110 (on certain motor types only)

From our website (www.mgmrestop.com) in the section DOCUMENTATION you can download documents, images or technical support videos:

- 2D and 3D motors drawings
- technical data sheets
- wirings
- use and maintenance manuals
- videos showing how to carry out the main maintenance work on the motors (also visible on smartphone or tablet)
- photos of spare parts to better identify them
- certificates (cCSAus, CCC etc)
- catalogues
- technical documentation of various kind

MGM Motori Elettrici SpA was founded in 1947. Right from the start the company specialised in the production of electrical brake motors, becoming one of the leader companies in the world in this industry.
In Italy MGM has the main production plant in Serravalle Pistoiese and a warehouse with sales offices in Assago (Milan).
MGM also has plants in Montreal (Canada), Detroit (USA), Chennai (India) and Izmir (Turkey). Around the world, MGM is present in more than 70 countries with its own structures for sales and assistance.
Anywhere in the world, you can hardly see, wear, or use anything which does not have at least one component produced by an MGM brake motor.

We are present in more than 70 countries in the world with sales point and after sales points:
Algeria, Argentina, Armenia, Australia, Austria, Azerbaijan, Bangladesh, Belgium, Bolivia, Bosnia, Brazil, Bulgaria, Canada, Chile, China, Colombia, Croatia, Cyprus, Czech Republic, Denmark, Egypt, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, India, Indonesia, Ireland, Israel, Japan, Jordan, Kosovo, Latvia, Libya, Lithuania, Malaysia, Malta, Mexico, Montenegro, Morocco, Netherlands, North Macedonia, Norway, Pakistan, Peru, Philippines, Poland, Portugal, Romania, Russia, Saudi Arabia, Serbia, Singapore, Slovakia, Slovenia, South Africa, South Korea, Spain, Sweden, Switzerland, Taiwan, Thailand, Tunisia, Turkey, Ukraine, United Arab Emirates, United States, Venezuela, Vietnam.

[^0]:    Note: all motors indicated in the table above can also be produced as standard asynchronous three phase motors without brake (SMX or SM Series)

[^1]:    Example BAX 71 B4 0,37 kW IE2 230/400V 50Hz class F IP 54 IM B5 AC brake coil, double terminal board box

[^2]:    Notes: * This type of flange requires a special shaft therefore it isn't interchangeable with the standard one. This flange increases the motor length $(Q)$ by 25 mm .
    ** This type of flange requires a special bearing while the shaft remains the standard one.
    *** The difference between the dimension of the reduced flange and the standard one (in brackets) doesn't affect the correct motor assembly.
    For 2 poles motors 225 frame size and above please contact MGM.

[^3]:    1. Motor characteristic values reported in the tables refer to continuous duty (S1), voltage $3 \sim 400 \mathrm{~V} 50 \mathrm{~Hz}$, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m above sea level operating condition
    2. The motor marked with * can be supplied with reduced shaft and flange
    with the dimensions related to the frame size 90 .
    3. The motors nameplates have the data relating to operation at both 50 Hz
    and 60 Hz with the same power value excent for the motors marked with ${ }^{\star \star}$. 4. BAX motor series have the same brake components as the BA with the same frame size, therefore the braking performance are the same. The maximum brake torque values indicated on the chart refer to AC brake, $D C$ brake on BA-BAX series is available on request only. 5. The maximum brake torque for BAXK 132 motors series is 120 Nm .
[^4]:    1. Motor characteristic values reported in the tables refer to continuous duty (S1),50 Hz frequency, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m . above sea level operating condition
    2. DC brake is provided on request only, on BA series motors. Brake current consumption values refer to a rated voltage of 3-phase 400 V for AC brakes and single-phase 230V for DC brakes.
    3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should
[^5]:    ${ }^{* * *}$ The EN 60034-30-1 standard specifies the IE efficiency classes for motors with power between 0.12 kw and 1000 kw . For motors with lower power it is therefore not possible to define the efficiency class, moreover these

[^6]:    ${ }^{* * *}$ The EN 60034-30-1 standard specifies the IE efficiency classes for motors with power between 0.12 kw and 1000 kw . For motors with lower power it is therefore not possible to define the efficiency class, moreover thes motors are outside the scope of the EU requlation 2019/1781.

    1. Motor characteristic values reported in the tables refer to continuous duty (S1), voltage $3 \sim 400 \mathrm{~V} 50 \mathrm{~Hz}$, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m above sea level operating condition.
    2. The motors nameplates have the data relating to operation at both 50 Hz and 60 Hz with the same power value except for the motors marked with ${ }^{\star \star}$

    Since the products are subject to changes and improvements, the data indicated cannot be considered binding. The data indicated must also be understood as being general in nature. For speciitic applications, please contact the MGM stafl.
    . The molor makked with * can be supplied with reduced shaft and flange with the dimensions related to the frame size 90 .

[^7]:    1. Motor characteristic values reported in the tables refer to continuous duty (S1), except for $4 / 12$ pole motors, 50 Hz frequency, ambient temperature max. $40^{\circ} \mathrm{C}$, altitude up to 1000 m . above sea level operating condition. 2. The expressed brake torque is the max admissible one. Brake current consumption values refer to a rated voltage of 230 V AC single-phase. 3. The table shows the sound pressure noise level, measured at one metre range from the motor according to the Acurve (ISO 1680). The shown noise levels refer to motor no-load operating condition and should
