Phoenix Weekly Release 0.0.0.1071

Phoenix Online DPMS

Weekly Release

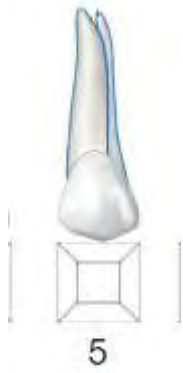

Build 0.0.0.1071 | October 6, 2017

These are the highlights of the new features available in this week's Phoenix DPMS release.

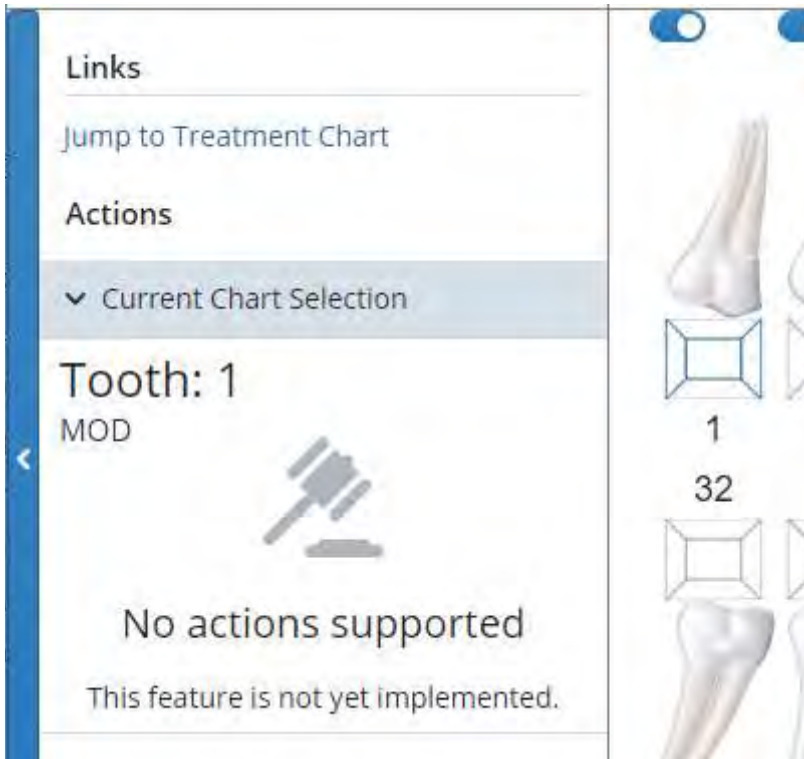

Restorative Charting

In last week's release, we introduced the hard tissue chart. This week, we have been doing a lot of backend work to enable the recording of charting events. We will continue to expand charting workflow support over the course of the next several weeks' releases.

This week's release addressed some anatomy selection issues - such as the selection of individual roots for both primary and permanent teeth can be selected for charting. Now, users are able to select the entire tooth (via the tooth number button), the entire crown (via the tooth's facial rendering), one or more of the roots (via the tooth's facial rendering), or a collection of crown surfaces (via the occlusal diagram).

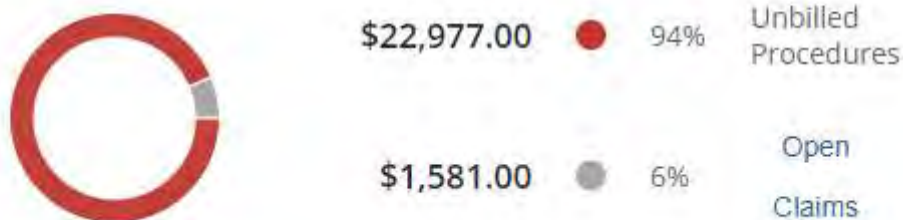

Additionally, the user's current selections are now displayed in the side panel to allow confirmation of what anatomy is being charted against. Next, we will allow users to apply diseases and conditions, visually represent them on the chart, and document them with automated notes. Additionally, we will handle managing anatomy selections across multiple teeth to support multi-tooth conditions as well as "charting by condition" workflows (e.g., charting all existing crowns at once).

Claim Processing Enhancements

We have also implemented a series of enhancements to insurance claim creation this week. A new "Claim Stats" KPI module has been added to the Location Homepage to help users manage and identify potential issues with claims-related revenue.

Claim Stats

This includes identification of location-wide procedures (charges) that have not yet been billed to patient insurance as well as reporting on the current revenue tied to open insurance claims. As with the other Location Homepage KPI modules, users can link directly to the Claims Management list to execute related workflows.

As we complete implementation of claims status management, this KPI module will be enhanced accordingly. It will soon show a breakdown of claims (and related revenue) by claim status, including open claims, claims that are pending, and claims that have issues that may require followup or resubmission.

Several other logical enhancements have been completed this week. This includes implementation of logic for preventing the creation of a new claim from non-applicable transactions such as adjustments (or adjusted charges). It also includes the prevention of modification or adjustment of charges that are currently linked to an open insurance claim.

Optimizations and Fixes

The following fixes and optimizations have been also been added to Phoenix.

1. Layout and rendering of the Location Homepage has been enhanced to improve the user experience on screens with lower resolutions.
2. Performance improvements made to the Patient Homepage.
3. Fixed issue related to the creating or updating of a record via Patient Connections.
4. Addressed various UI layout / alignment issues within the schedule worklists.
5. Sample / demo data has been moved forward to the current date.
6. Addressed calculation of the production / collection values on the Location Homepage.

Love the chart, have been looking at it in the latest release and I am glad some of the best bits from our existing DPMS's seem to be represented!

I love the Claim Status. This will be a huge hit - easy claim management. The clinical work looks modern and clean.
