**DESCRIPTION ANADROL® (oxymetholone)** Tablets for oral administration each contain 50 mg of the steroid oxymetholone, a potent anabolic and androgenic drug. The chemical name for oxymetholone is 17 $\beta$ -hydroxy-2-(hydroxymethylene)-17-methyl-5 $\alpha$ -androstan-3-one. The structural formula is: This medication is a synthetic male hormone (androgen or anabolic steroid) used to treat a low red blood cell count (anemia). It works by increasing the amount of the hormone (erythropoietin)... Anadrol-50 is an anabolic steroid, which is a man-made form of a hormone similar to testosterone. Anadrol-50 is used to treat certain types of anemia (lack of red blood cells), including anemia caused by chemotherapy. Anadrol-50 will not enhance athletic performance and should not be used for that purpose. Anadrol 50 Administration: Anadrol carries an active half-life of approximately 16 hours, which will require daily administration of the hormone. Most men will find a dosing of 50mg per day for 4-6 weeks to produce phenomenal results. Use should not surpass the six week mark for any reason due to the steroid's

hepatotoxicity. The Anadrol half-life is only 8 hours, which means that you should take it twice daily to keep drol at consistent levels. So if you have Anadrol 50 (mg), for example, and wanted to run 50mg per day, you'd just split the tablet in half and take one half in the morning and the other half at night.
