

” Reduction in healing time

One of our prominent race horses became lame and was diagnosed with a fracture in the joint capsule in the coronet. The vet recommended a training-free period of 7-9 weeks and treatment with the PowerLaser 2-3 times a week. After 6 weeks of laser treatment, they did a control scan and gave us the go-ahead to start rehabilitation. 1-3 weeks sooner than the vet had expected. This gave us the indication that the PowerLaser works, and we now use laser therapy on several of our horses, including for wounds, locked muscles, and injuries in the coronet, knee etc.

Laser therapy
Information about laser therapy for horses

What is laser therapy?

Energy

Laser therapy is intensified energy for the natural healing. The laser light penetrates deep into the tissue, into each individual cell.

The cell absorbs the energy from the laser light and promotes all of the body's natural repair mechanisms.

Laser therapy reinforces the healing process and strengthens the immune system. Laser therapy supports the body's own functions and makes them happen markedly faster.

Accelerated Natural Healing™

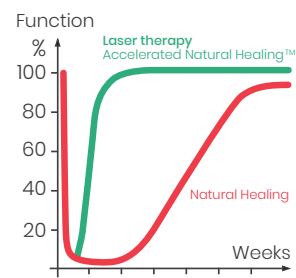

Time

The healing time for acute injuries is significantly reduced. Wounds heal quickly and effectively.

The following are typical examples:

- **Sprains:** Fully heal in 6-8 days
- **Wounds:** Heal up in 2-3 weeks
- **Inflammation:** Resolves in one week
- **Tendon injuries:** Heal up in 3-4 weeks
- **Bone degeneration:** Laser therapy reduces pain and increases mobility
- **Muscle tensions:** Release effectively

Healing time after an injury

How often should you treat?

It depends on the specific problem, whether it's an acute injury or a repetitive strain injury sustained over a longer period of time. Typically 5-10 treatments over the course of 2-3 weeks. One laser treatment typically takes 2-15 minutes and is often combined with other treatment.

Does it hurt?

Laser therapy itself is painless, and most animals appear to enjoy the treatment.

Are there any side effects?

There are no known side effects to laser therapy. At the most, there may be a therapy reaction, such as increased discomfort in the treated area. This is perfectly normal and will usually go away within 12-24 hours.

When not to use laser therapy?

At this time, we do not recommend treating animals that are pregnant or have been diagnosed with cancer.

There's currently no documentation indicating that laser therapy would be harmful in these cases, however, just to be safe, and to avoid liability issues, we do not recommend using laser therapy for pregnant animals or those with cancer.

Is laser dangerous?

It depends on the power and the type of laser. All lasers from PowerMedic are developed according to current standards for medical equipment. This means that known risks are eliminated or minimized so that the treatment can be applied as safely as possible.
