- Footplates are available for fixing to a solid floor or posts can be sunk into the ground
- For further information please follow this link for our installation videos and instructions: www.thegardenspace.co/pages/downloads

* At 6078 projection we would recommend an additional support post for each side

Privacy Panels

These are commonly used to close off the top part of a side above a neighbouring fence or to square off a side so a glass sliding door system can be fitted below.

The privacy panel kit comes with one piece of polycarbonate sheet 980mm tall, two 4.2m edging sections and one 2m edging section. All will need to be cut to fit the appropriate space you wish to fill.

There is a choice of polycarbonate panel type to match your roof or suit your purpose for example use Opal if privacy is your aim or use Ultra Clear if you are looking to maximise a view above a sliding glass door system.

Please see our fitting instructions for further information:
www.thegardenspace.co/pages/downloads

Side Walls

This kit is used to close off one side of your canopy making it more homely and shielding you from wind and rain.

The side wall kit comes with several 3000x980mm polycarbonate sheets depending upon the projection chosen, 2 x edge profiles at 4.2m, 2 x edge profiles at 3m and 3 x joining profiles.

The side wall kit parts will need to be cut to suit your canopy size and shape.

There is a choice of polycarbonate panel type to match your roof or suit your purpose for example use Opal if privacy is your aim or use Ultra clear if you are looking to maximise a view.

For further information please see our fitting instructions:

www.thegardenspace.co/pages/downloads

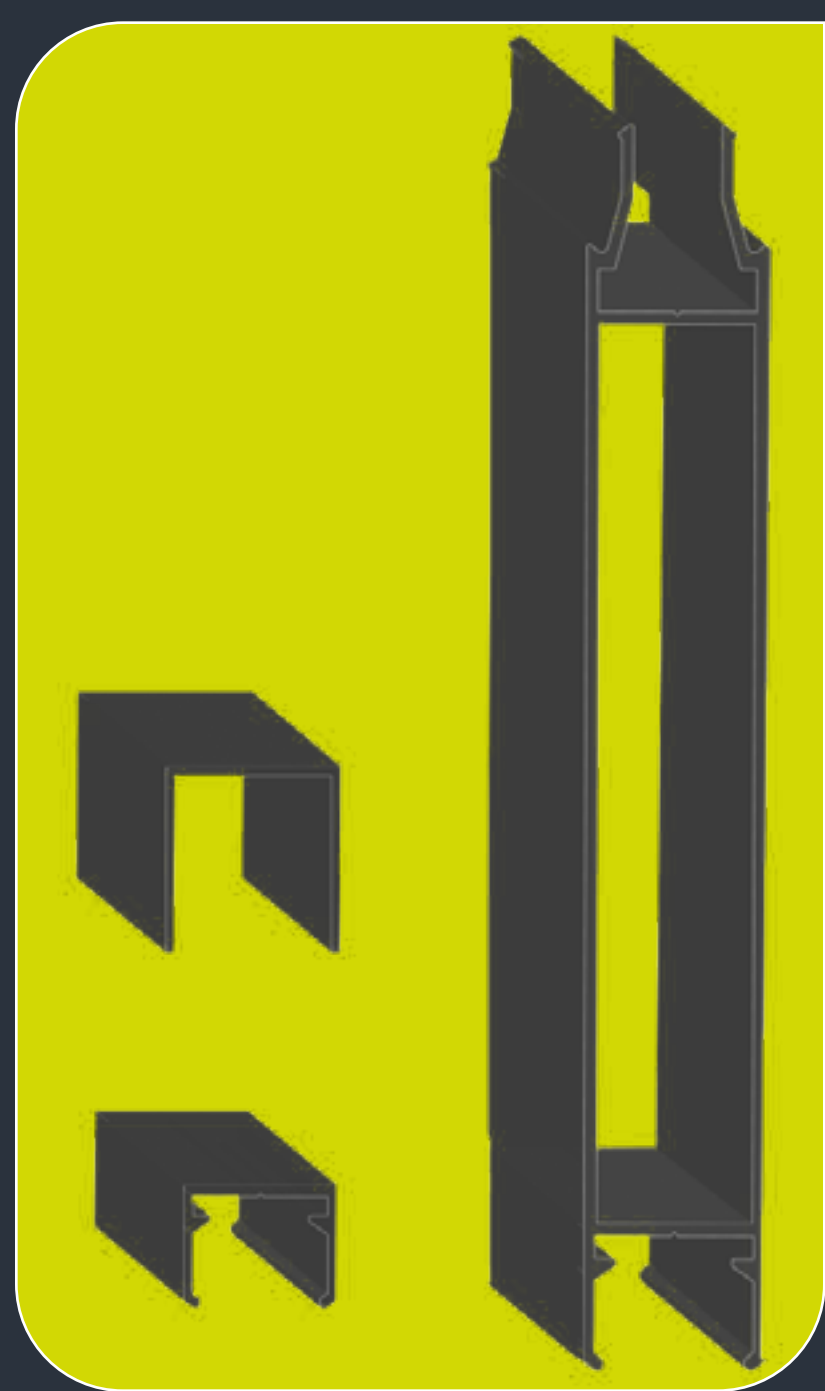

Aluminium Fixed Panel System

This versatile panel system can be used in a variety of ways. Ideal to make fully enclosed sides, low level walls or whatever design your imagination can conceive - they even make great side walls for custom built planting boxes that blend in with your canopy!

The system is very simple to work with using an edging section, panels that interlock and a top cover which will clip onto a full top panel to be used instead of the edge channel if the top is to be open.

Using posts sections and box sections there are endless design options and useful applications.

The panels patented tongue and groove system provides a sturdy and weather resistant join.

Each panel is 25mm wide has an overall height of 166mm and when joined together each panel covers 150mm with the remaining 16mm being inserted into the panel above.

Aluminium Fixed Panel System *continued*

Built from high quality aluminium the panels are both lightweight and extremely durable.

For further information please see our fitting instructions:

www.thegardenspace.co/pages/downloads

Glass Sliding Doors

The Glass Sliding Doors can be used to the side or front of your canopy and in fact can be fitted almost anywhere.

The system is straightforward with top and bottom track, side channels and glass panes that fit between the tracks with a roller system that clips on.

You can choose various different quantity and width combinations of glass panes to suit our space and requirements e.g. a space of 4m could be fitted with 4 x 1040mm wide panes or 7 x 640mm panes.

Panes come in the following sizes:

There is adjustment in the sliding mechanism which means a range of opening heights can be achieved as shown in the table.

Width (mm):	640	820	980	1040
--------------------	-----	-----	-----	------

Installation height	Opening height flexibility
2000	1980 - 2025mm
2100	2080 - 2125mm
2150	2130 - 2175mm
2200	2180 - 2225mm
2250	2230 - 2275mm
2300	2280 - 2325mm
2400	2380 - 2425mm
2500	2480 - 2525mm

Additional space can be created by using box sections which are available in 100mm or 60mm heights.

Glass Sliding Doors *continued*

The panes need to overlap with a 35mm minimum recommended (55mm minimum if closing the middle panes against each other in the centre of the opening rather than having all opening to one side).

Panes are available with a handle which is fixed through a pre-cut hole in the glass (one or two normally required per system depending if opening to one or both sides).

An optional auto close/open system is available so that when the first door is moved, the others are then pushed/pulled with it automatically.

Brushes that clip to the sides of the panes are available to help further weatherproof the system together with brush edge finishing channels that go into the side trims.

We have pre-set kits available using an overall height of 2400mm which means they will fit in a gap of approx 2380-2425mm.

If you are fitting to the underside of a privacy panel it is imperative that your privacy panel is fitted to create the correct gap. If you are fitting to the front of your canopy then if you have used full leg height (2.5m) then you will need a 110x110mm box section to fit to the underside of your gutter to make up the gap.

Glass Sliding Doors *continued*

Our kits include:

- 2 x U sections to go to each side of the opening
- Top & bottom tracks
- Glass panels to suit width
- One panel with in-built handle
- Auto open/close system for each glass panel (when more than 2)
- Weather brushes which clip onto each glass
- Brush-edged finishing trims to go into each side section

2m kit contains: 2 x 1040mm panels

2.5m kit contains : 3 x 980mm panels

3m kit contains: 3 x 1040mm panels

3.5m kit contains: 4 x 980mm panels

4m kit contains: 4 x 1040mm panels

If our kits don't suit your needs then create your own kit from the individual parts or contact us for a customised quotation.

Call: **0121 415 3811**

Email: team@thegardenspace.co

LED Lights

The LED light packs contain 6 or 10 LED lights (depending on which size is chosen) with cabling, remote, control pack and transformer. The lights drop into a 28mm hole which can be cut in the underside of mid support bars to illuminate your canopy or garden room.

The transformer must be connected to the mains in line with relevant regulations and by a suitably competent person.

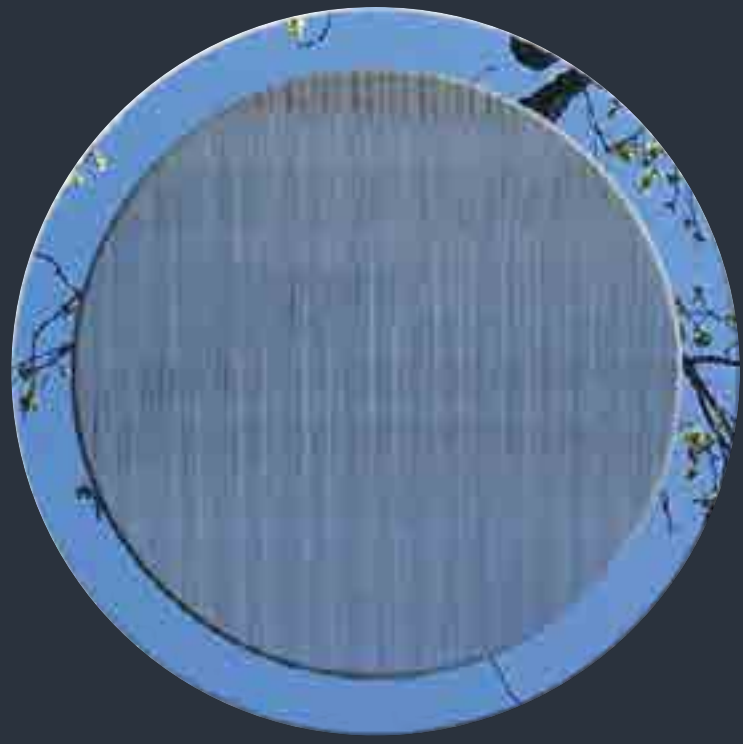

For further information please see our fitting instructions:

www.thegardenspace.co/pages/downloads

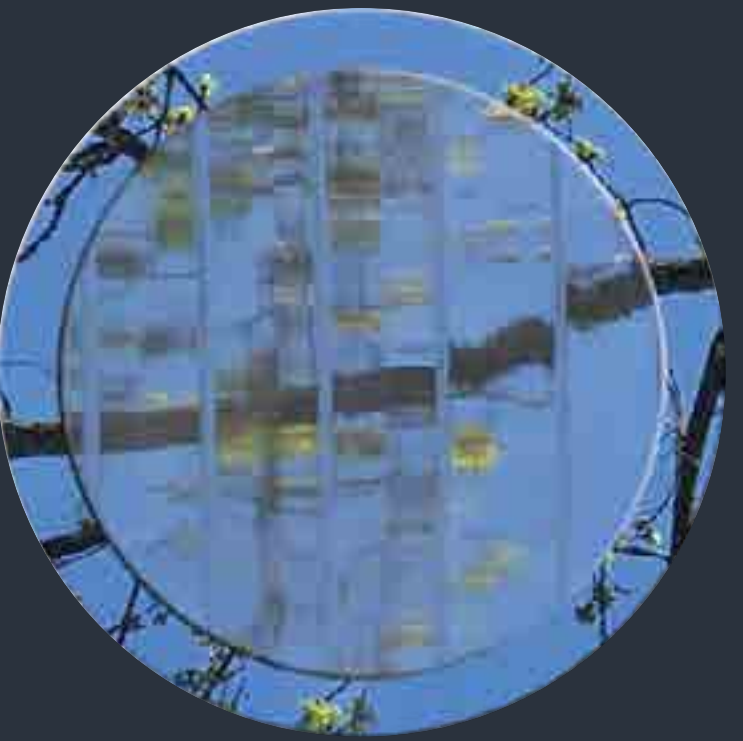

Roof & Panel Options

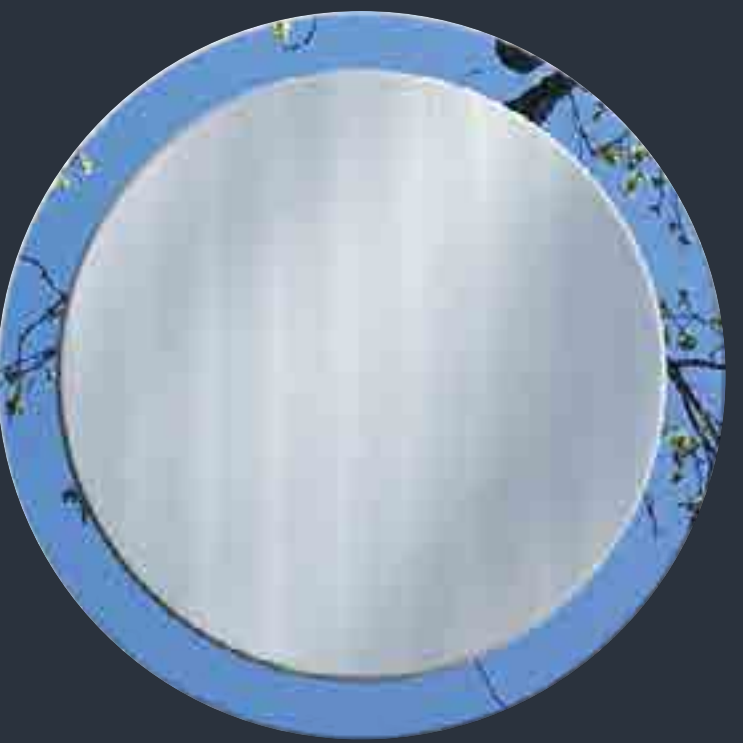

Opal: White in general appearance, great for allowing in light as semi-transparent but also great for privacy as little more than rough shadows can be seen. The most popular choice as also does not show dirt/marks easily.

Clear: This is relatively transparent but flutes (walls) inside means you can't see through it particularly well. Let's in a great deal of light.

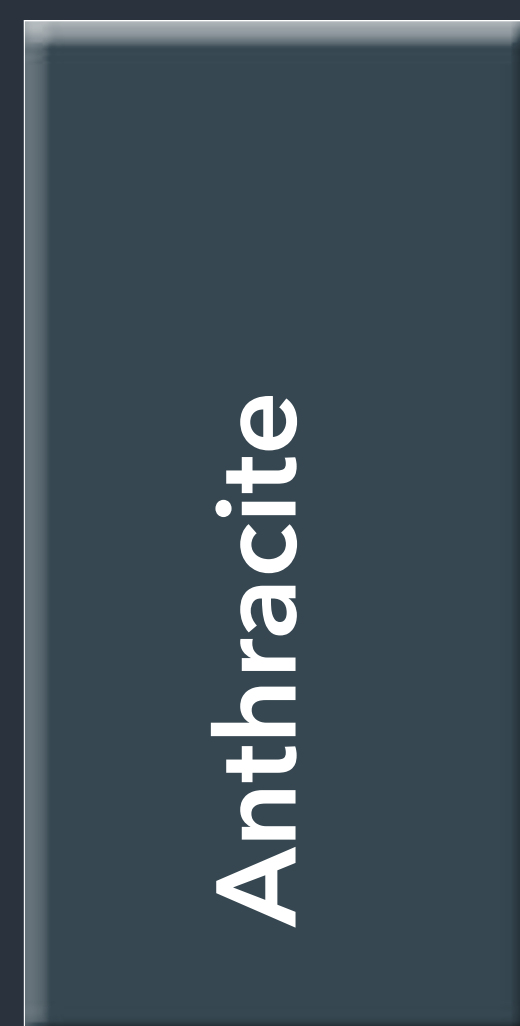

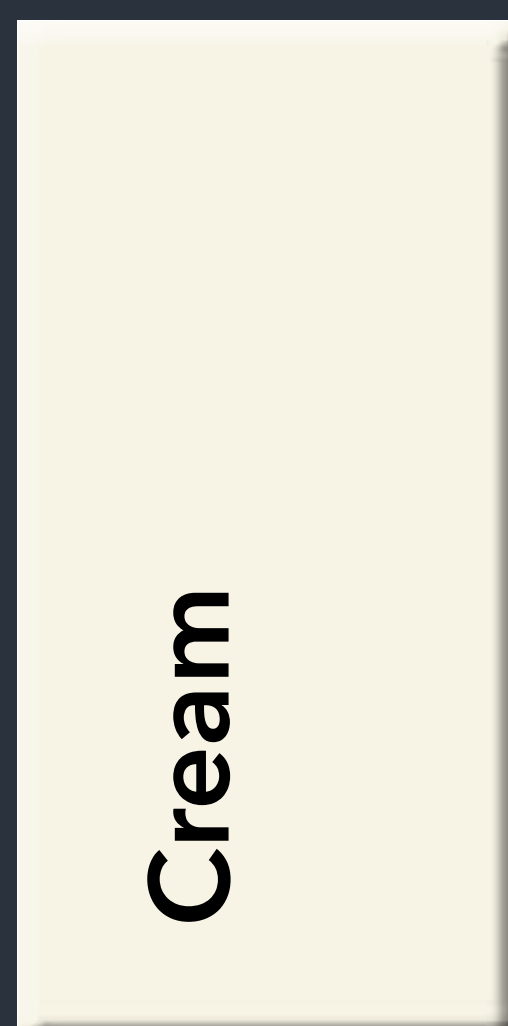

Ultra Clear: With less flutes (walls) inside it is the most translucent and almost like glass. Lets in the most light and gives the clearest view.

Solar: Similar to Opal but protects from UV which means keeps rooms cooler.

Now that you have decided on your canopy, choose the roofing material to suit - Polycarbonate is a sturdy, flexible material, making it perfect for roofing. Easy to install and clean. Use the images above to help you make the perfect choice.
