

Hypoallergenic!

FOR DOGS WITH FOOD SENSITIVITIES

The most common allergens in dog food are protein sources: chicken, beef, dairy, and egg. A time-tested solution for food allergies is to feed sensitive dogs hydrolyzed protein, a type of protein that is predigested and does not spark a reaction in the immune system.

Recently, research has shown that insect protein may serve a similar purpose. A 2018 study concluded that insect protein-based dog foods are a promising alternative for dogs with food intolerances. Twenty dogs with skin problems related to food sensitivities were fed cricket protein-based food in a long-term feeding trial, and 60% of them showed significant improvement in their symptoms.

DOGS ARE THRIVING

“After eating this food for about a month, we went and got a full checkup for our dog and she has excellent results.”

“One of my dogs is allergic to literally all proteins and is on a hydrolyzed diet, so I was excited to find a new product to see if she could handle. She LOVES these treats and she hasn't had any reactions to them!”

“I transitioned my dog to Jiminy's, and she has had more energy and her digestive issues are all gone.”
