IN-CAR AMPLIFIER

ESX QE1200.4

ESX QE1200.4

If amplifiers in the car are supposed to meet two requirements, it is firstly that they deliver a decent performance without, secondly, taking up all of the available space. With its 1200 watt output power distributed over four channels, housed in a remarkably compact, but solidly constructed housing, the QE1200.4 fulfills these requirements with flying colors. Thanks to the digital amplification, she can keep a cool head; In combination with the comprehensive measures to avoid interference signals, the automatic switch-on and the ability to recognize connected loudspeakers, it is ideally suited for hidden installation. If you add the configurable crossovers and the option to operate bridged subwoofers, you have the ideal addition to both factory and retrofit systems that offer first-class sound and the same design at an affordable price.
