

**Attention:** When **filling and capping a product for the first time**, we recommend conducting a trial run of **50-100 pieces** and performing inhale tests. Based on the test results, users can adjust their filling and capping process to achieve optimal performance and minimize the failure rate.

## Eros SE Filling Instructions

Recommended Needle Size	Ideal Fill Temperature	Capping Time
15 Ga (or $\leq 2.0\text{mm}$ )	122° - 140° F / 50° - 60°C	1 ½ minutes

Unpackage the Eros SE vapes and make sure you have both the mouthpieces and tanks ready.

Place the empty vapes vertically upright on a flat surface.  
**Caution:** Do not remove the silicone gasket during the filling process.

Preheat the oil to the correct temperature for your specific oil (i.e.,  $\leq 135^{\circ}\text{F}$  (or  $57^{\circ}\text{C}$ )).

Fill the vapes using an oil syringe or filling machine; the recommended needle size is 15 gauge (or  $\leq 2.0\text{mm}$ ).

Fill the oil according to the tank capacity through the open top, avoiding the center post. Keep the open hole unobstructed to allow air to escape.

**Caution:** When using a needle, insert it to a depth of 3/4 of the oil tank and do not touch the bottom.

# Eros SE Capping Instructions

Capping Time	Capping Method	Min Capping Force	Max Capping Force
1 ½ minutes	Machine ONLY	22.05 lbs (10 kg)	33.07 lbs (15 kg)

Secure the mouthpieces onto the tanks by aligning them vertically and applying even pressure.

For optimal results, complete the capping within 1 ½ minutes of filling the oil. For oils with thinner consistencies, **be sure to cap them promptly to prevent leaking.**

**For very thin oils:** After filling and capping, **invert the vape hardware immediately** and let it cool for about **30 minutes** before placing it upright. This helps prevent excess oil from seeping into the ceramic core before use.

**For very thick oils:** Allow the vape hardware to sit for **30 minutes to 24 hours** after filling and capping to ensure the oil fully saturates the ceramic core before use.

Store the final products in a dry, cool place away from direct sunlight. Storage temperatures should be between 68° - 77° F (or 18° - 25° C).

## Additional Info:

- After filling, the ceramic coil of the Eros SE will absorb some of the oil; this can result in a noticeable reduction in oil volume (up to 10%) and create extra space in the tank.
- Eros SE vapes are compatible with most capping machines.
