

# Bariatric (Obese)

This is the only rescue dummy in the world to simulate not only the weight of an obese patient but also the flesh bulk and movement experienced with these patients.

Obesity is becoming a very real problem for Ambulance and Fire crews across the world, and the problem is getting worse. Rescue and patient handling teams will need to consider how they will deal with casualties of this size and this dummy will enable realistic and challenging training.

A Bariatric dummy needs not only to be very heavy but must also have a bulk of flesh that moves and realistically simulates the extra difficulties in manoeuvring these patients.

The design team worked very hard to achieve a 'fluidity of movement' with the weight rather than just producing a heavy 'lump'. This was achieved by using a standard 100kg General Purpose dummy at the core and then fitting multiple extra tailored jacket layers around the dummy. These extra layers alternate between a jacket layer incorporating 0.5kg weights sewn into pockets with a layer integrating foam cushioning of the right flexibility. The result is a bulky flesh weight that moves from side to side and is very realistic.

**MADE IN  
BRITAIN**

Model	Description	Height	Weight
RLN90	(Light) Bariatric Adult	1.8m	90kg
RLN180	Bariatric Adult	1.8m	180kg
RLN260	Extreme Bariatric Adult	1.8m	260kg
RLWF150	Water-Fillable Bariatric Adult	1.8m	150kg

The Bariatric dummy is consequently very challenging to manoeuvre because it is so heavy and very bulky. It is designed for a team of at least 4-6 people to rescue. It is supplied complete with a strong carrying sheet to assist in carrying and positioning the dummy. For the hospital teams a set of pyjamas are also supplied.

Our Bariatric dummies are custom built, so please allow 3-4 months before ordering. Standard weights are 180kg and 260kg. We also have a 'lightweight' Bariatric at 90kg, but it has the same bulk as the two heavier versions, allowing your teams to practice their technique on a lighter version.

Only by using this dummy will the real life problems encountered with these patients be appreciated, and strategies developed for their extrication and transport. This is a real 'team effort' dummy!

**Water-Fillable version is now available for hire or purchase. Please call for more details.**

**NEW  
Water-Fillable  
Bariatric Suit**

**This is a new addition to our Bariatric range and allows customers to place a manikin in situ before adding the weight.**

It comes complete in a bag for easy carrying and storage. It is light enough for one person to carry into position and set up the training scenario. Simply place the suit over your existing manikin, attach a hosepipe and fill it up with water to achieve the required weight. Up to 150kg of additional weight can be added using water.
