

The Patient Handling Manikin range is aimed at Hospitals and Health care to help with moving and handling. The Emergency Evacuation Manikin is designed to help Care Homes comply with their Evacuation responsibilities.

FEATURES & BENEFITS

- Designed and tested with moving and handling experts to provide the perfect manikin for patient handling training.
- Constructed with an elongated plastic spine that allows the manikin to sit upright in bed, a wheelchair or hoist - essentially acting as a 'conscious' patient.
- Constructed with plastic strips in the thigh to prevent too much bend when hoisting.
- Soft body joints to eliminate the risk of pinch welts and bruising; common injuries when using plastic bodied manikins.
- An immobilisation/extrication collar can be fitted around the neck of our adult manikins to promote proper casualty care.
- **Detachable arms and legs to simulate amputations. This also reduces the weight of the manikin to aid in transportation and storage.**
- Supplied undressed, so that you can dress it according to your scenario in pyjamas or day clothing - we advise that you wash clothing between training sessions.
- Constructed from the same flame retardant material used in Police ballistic/stab vests: (conforms to OEKO-TEX® Standard 100, BS EN ISO 12947-2 & 14116: 2008)- the material is tough, safe to handle and very easy to clean.

Helping to reduce person-to-person contact.

A versatile manikin for all Health & Safety training within the Hospital and Care sector, including: early mobilisation, working with lifting/transfer/evacuation equipment and general moving and handling exercises.

Help your staff to avoid the risks identified in the Manual Handling Operations Regulations 1992 (Health and Safety at Work Act 1974) and train them to avoid the back injuries associated with unsafe, high risk moves by training with these realistic 'patients'.

Model	Description	Height	Weight
RLNPH30	Patient Handling Manikin	1.8m	30kg
RLNPH50	Patient Handling Manikin	1.8m	50kg
