

GREENER KLEENER

Universal Cleaner & Sanitizer

Pressure washing is often a popular solution to cleaning a driveway while this may remove the visible signs of moss, weeds, algae and lichens it will not kill the spores that cause the problems. Too much pressure on your driveway can also damage its integrity especially sand filled "sets" or in bursting porous asphalt. Greener Kleener is applied at tap pressure, after treatment natural cycles of rain and sun will wash away bacterial contamination. Greener Kleener has a pH of 6 so is virtually neutral pH and, once dry, safe for animals and children. As a surface biocide treatment Greener Kleener is non-invasive and will not alter or discolour your driveway.

Greener Kleener is easy to use free of bleach, free of caustic and acidic chemicals. It keeps further staining at bay for at least a year. After the initial application, further maintenance cycles will be a much shorter process, making it easy to stay on top of your driveway maintenance.

Greener Kleener is licensed by HSE as a DIY biocide treatment for biological staining eradication - it is also designated as a WOOD PRESERVER under the EU Biocides Regulation. Greener Kleener is the same product as our "Professional Use Only" GK Pro, formulated for DIY use and licensed by the Health & Safety Executive.

DRIVEWAYS

HOW TO STEP-BY-STEP

Prior to treatment on a dry, rain-free day, with no rain forecast for at least 4 hours. Sweep, brush and mechanically remove loose debris and any bulky vegetative growths from your driveway. Cover nearby plants and grass areas with a tarpaulin or waterproof cover (it's safe on hard surfaces).

When using Greener Kleener always wear appropriate clothing to avoid contact with skin including gloves and safety goggles or face visor. Pour tap water into your preferred container before Greener Kleener - it is a surfactant and foams up vigorously like washing up liquid!

Can be applied with a garden pump sprayer, sponge, watering can, roller or brush. Saturate the surfaces inside and out (slightly wetting is not enough) at around 0.33 litres of mix per square meter. Simply spray and leave. Allow to evaporate naturally. It is important that the surface is dried.

For heavy bacterial loads you may decide to brush-in, agitating will loosen and move grease & grime, the dirt will be held within the solution. You may want to rinse this off and follow up with a preventive spray as indicated above.

WHAT TO EXPECT

Most bacteria will be invisible within 15 minutes of treatment, evidence of dead biofilms will be seen as a change of staining colour by days end, the staining will desicate and powder away using natural cycles of sun and rain, this timing is weather dependent but evidence of staining is usually gone within two weeks.

If there has been BTB-coloured for three weeks and staining remains it may be useful to hose down your surface. If some staining persists it is probably not bacterial in nature, seek advice as to the cause and the appropriate treatment.

WARNINGS

- Not for use on leaves as a moss remover
- Avoid overusing onto grass and plants, may wash foliage, an accidental spray stream with water immediately
- Keep children and pets away while the area is used
- Safe once dry
- If difficult to remove access Greener Kleener may be rinsed off with clean water after 1 hour
- Reduced spray time (maximum 1 minute), has the potential to harm aquatic life
- Should spraying in high winds

GOGGLES, GLOVES AND FACE MASKS REQUIRED
