NightSky LED® Recondition Program

When industrial LED fixtures get old, past warranty or get damaged they are usually thrown away and replaced with brand new ones. Large and unnecessary material wastage occurs this way.

NightSky LED lighting systems, on the other hand, can be repaired or retrofitted on site using standardized universal and interchangeable parts. Most of these parts are backwards compatible which removes a necessity of keeping old stock available throughout the warranty period. Brand new parts manufactured today will fit and work on older NightSky LED® systems.

Unfortunately, some facilities do not have ability to take fixtures to the shop and work on them or simply have too many fixtures installed and do not have dedicated personnel specifically assigned to maintaining and rotating lighting inventory.

To promote wastage reduction and to help our clients with their maintenance load NightSky LED® fixtures can now be sent to one of our Service Centers for “reconditioning”.

Each client gets customized set of services that fit their needs. For example, some clients send a batch of LED fixtures every specified period of time that is synchronized with their maintenance schedule. Even if you have only one NightSky LED® fixture, you are welcome to take advantage of this program.

Some standard services are listed below.

- LED light fixture gets cleaned and inspected
- All damaged components are replaced or repaired
- All recovered materials get fully recycled
- All brand-new consumable parts are installed (LED modules, LED Drivers, etc.)
- Any additional accessories (different optics, diffusers, brackets, shields, etc.) could be added
- Complete service reports are available upon request
- Reconditioned lighting system receives standard warranty terms
- Newly assembled system gets tested, packed and shipped back to site

Please contact your local NightSky LED® representative to inquire about our Reconditioning Program.
