# FiberSmart

## Problem

The telecommunications market is growing at an incredible rate, and with that growth comes the need for faster, more reliable fiber connections.

The process of connecting new customers is still slow and expensive

Existing fiber connection technology just can't keep up with the demand. Copper-based technologies like twisted pair & Ethernet are struggling to meet the needs of today's bandwidth-hungry applications. Companies are looking for new & innovative ways to improve their services.

Coupled with this, Telecom providers are struggling to keep up with the increasing demand for fiber connections. This can lead to long wait times and frustrated customers. It can take weeks or even months to connect a new customer, and the cost of doing so is skyrocketing

## Solution

Fibersmart offers a new way to make fiber connections using robotics instead of people. Our CoLo Customer Cage Automation system uses ROME automation robotics to make quick, reliable fiber connections.

This system speeds up the process of connecting fibers and allows companies to keep up with the competition.

This also allows telecom providers to quickly and efficiently connect customers with services such as Azure, AT&T, AWS, and many more services.

Our CoLo Customer Cage automation system reduces costs, speeds up the process, and also ensures accuracy and consistency.
