HOW TO GET THE MOST OUT OF YOUR HOUSE & GARDEN FEED REGIME

House & Garden Feed charts contain suggested nutrient levels based on our experience and/or testing completed with House & Garden Products.

Shooting Powder/ Top Shooter - remember , use either **NOT** both.

First, add base nutrients and other additives to achieve EC 1.2/PPM 840, mix well and adjust PH to 5.8 before adding Shooting Powder/ Top Shooter.

Mix required amount of Shooting Powder in a bucket with a small amount of water until dissolved, then add to reservoir. The PH will rise slightly which enables the plants to absorb P&K easier. DO NOT adjust PH (unless PH exceeds 6.5).

FLUSH EVERY WEEK WHILST USING SHOOTING POWDER/TOP SHOOTER. Results are visible in 2-3 days

Roots Excelurator creates a film around the roots, therefore isolating any disease or pathogens and stopping their reproduction. It also ensures explosive root growth, which results in quicker grow times, translating into more crop cycles per year. Use as per feed charts, except if plants have suffered stress due to : heat/wrong PH /root rot or pest attack, in which case use with every feed. Roots Excelurator works great as a repair agent if plants have suffered a scarid fly/fungus gnat infestation once the infestation has been controlled).

Amino Treatment's basis is extracted from plant seeds. Plants provide their seeds with a reserve of enzymes and amino acids promoting root development and leaf quality. Amino Treatment results in better nutrient distribution in the leaves, a higher photosynthesis ratio, stronger stems, increased root activity, increased fruit production and higher sugar content. Introduce Amino Treatment gradually starting @0.2ml/Ltr for the first week, slowly increase the dosage until 1ml/Ltr is achieved - as referenced on the feed chart. Amino Treatment can be introduced at any stage of a nutrient regime.

Drip Clean forms an ionic bond with salts, making it impossible for them to build up in the plants medium or root system. Use of Drip Clean from the beginning through to the end of the fertilizer regime will reduce the need to flush and make for a better tasting fruit. Remember Drip Clean is mega concentrated @0.1ml per ltr, Drip clean is a completely safe agent for your plants provided it is used in the right proportions. Drip Clean is ideal for use in all types of grow systems and mediums. Remember, Drip Clean works at its finest with new feed lines and feed rings/drippers.

Bonus products for increased results! These products should be viewed as optional extras.

Algen Extract is a great booster derived from Norwegian sea kelp, can be used throughout @ 0.5-1ml/ltr. Remember If you are using Amino treatment you don't need this product.

Nitrogen N27% is ideal for super fast vegetative growth, use @ 1ml/ltr. Can be used during first 2 weeks of flower @ 0.5ml/ltr.

Magnesium 8% is great for summer high growroom temps and bad quality water. Remember only 0.5ml/ltr.

Foliar Spray is mega concentrated @1ml/ltr. Once per week MAX , grow period only.

Trace Mix is only used for replenishing sick plants with essential trace elements @1ml/ltr.

PH Stabiliser is a very useful product which is only needed if you are using pure water sources particularly Reverse Osmosis and experiencing extreme PH fluctuation.

WARNING: Different plants may react differently. Watch your plants closely for signs of nutrient toxicity /deficiency and adjust nutrient levels accordingly

HANDY HINTS & GUIDELINES

BASE NUTRIENTS

Cocos A&B nutrient is designed for use with any system utilizing 40% coco peat or more. For all other systems we recommend using Hydro A&B nutrients.

GENERAL MIXING INSTRUCTIONS

1. Fill reservoir with water (low EC/PPM preferred)
2. Add A component- mix thoroughly and let stand
3. Add B component- mix thoroughly and let stand
4. Adjust PH: For Cocos/Hydro – PH 5.8-6.0
For Soil A&B – PH 6.3
5. Add appropriate stimulants/additives
