PU leather
MAINTENANCE

PU leather is artificial leather polymer made of polyurethane, and is 100% vegan. It's long lasting and hardwearing when compared to natural leather.

Most liquids will be repelled by the PU leather. Dyed clothing can transfer onto light colours of PU leather. If you notice colour transference, wipe the stain immediately, as it can penetrate the surface if left.

For regular cleaning, use a dry cloth or vacuum to remove loose particles of dirt and food. Clean the surface with warm water and mild washing up liquid (no harsh detergents) using a non-abrasive cloth. Wring out excess water from the cloth and wipe over. Follow up by drying the surface with a soft, microfibre cloth. This will stop every day marks from building up.

spills & stains

To remove stains, mix a tablespoon of mild detergent with water in a spray bottle and shake vigorously. Spray the mixture onto a clean towel or cloth and wipe the stain. Gently scrub the stain if required.

stubborn stains

For stubborn stains like ink or dye, mix equal parts of water with vinegar or alcohol. Try the mixture on a discrete area of the PU leather to ensure it won't discolour the surface. If no discolouration occurs, dip the cloth into the mixture and blot the stain. Repeat using a clean area of the cloth.
