CRACK

KNOT

COLOR VARIANCE

BLUE COLORING

Thanks for purchasing our one of a kind wood stumps, this product has made it all the way from Aotearoa (New Zealand) via Asia to reach you. The New Zealand native pine material reaches the highest of sustainable replanting programs and is grown over 20 years and this is why we offer you a unique large single piece of wood, no joins or glueing takes place.

For these reasons the natural product has its own unique characteristics and reacts differently to different situations.

CRACKING:

We have done everything we can to tame this natural material, from drying the wood to moisture level which is stable to most environments, over time these small cracks may open bigger and when reacting in different environments, whether dry, wet, hot or cold. The wood is natural and reacts differently.

BLUEING:

Sometimes you will notice some blueing on the product, this is due to the natural tenons inside the wood coming out to the surface, we have treated these at source but sometimes this may rise to surface again over time. The material integrity is ok and again, its a large natural piece of wood.

FINISHING:

We selected to use water based finishing materials with a hand stained application, this is in keeping with the natural history, process and look of the product. If you notice that the small cracks are opening and exposing the inner natural material then please do the following

1/ Sand all splinters down using a sandpaper (we recommend 180grit).

2/ Apply a natural oil or water based stain (either black or natural pine finish) and please apply with a wet cloth and wipe dry. (please follow the instructions of the stain supplier).
