

CARE GUIDE FOR pH METERS

WHAT IS pH?

pH is a measurement of how acidic or alkaline a solution is. It is measured in numbers; the lower the number, the more acidic the solution. The higher the number, the more alkaline the solution.

Acidic

Neutral

Alkaline

WHY MAINTAIN THE CORRECT pH LEVELS?

The impact of incorrect pH levels can vary from application to application. For example, plants absorb nutrients within a certain pH range, so an incorrect level may affect the rate of growth and fruit yield. When brewing, an incorrect pH level can produce a poor quality taste and affect shelf life. At the other end of the pH scale, a fruit juice producer will have to control pH to avoid poor quality and the risk of causing health issues if the pH drops too low. An incorrect pH level within the pharmaceutical industry could result in producing undesirable toxins. Consistent and precise measurement of pH is fundamental in achieving the result you require.

MAINTAINING YOUR pH METER

- If you don't look after your pH meter then incorrect measurements of pH levels may occur.
- As a minimum you must always clean the pH electrode by holding it under a running tap, if the pH electrode is excessively dirty a cleaning solution can be used or alternatively use purified water. Leave the electrode in the cleaning solution for at least half an hour, preferably overnight to ensure a thorough clean.
- After soaking overnight, rinse the electrode and then soak in a 4 pH buffer solution before giving the electrode a final rinse. The electrode should then be ready for use.
- When not in use, ensure the pH meter electrode is kept moist in either storage solution or a 4.01 pH solution. If the sensor is allowed to dry out completely, the instrument's performance will be affected and its guarantee invalidated.
- If an electrode has been allowed to dry out or becomes slow to respond it may be rejuvenated by soaking the electrode overnight in a cleaning solution. Avoid touching the glass bulb at the end of the pH electrode at all times as this can easily cause damage.

CALIBRATING YOUR pH METER

To ensure accurate measurements, it is necessary to calibrate/standardise pH meters on a regular basis. For this you will require pH buffer solutions. These standard, inexpensive solutions are used to check that the pH reading is correct. If it is not, it can be easily corrected following the procedure for the specific instrument.

Generally pH electrodes have a limited working life, dependant on the frequency of use. This life is approximately twelve months or 365 measurements.
