

TABLE OF CONTENTS

Preface, Acknowledgements, Cover photograph and Permissions	i
Introduction	vii

UNIT I : SAFETY IN THE CHEMICAL LABORATORY

I.1. Emergency Equipment	1
I.2. Protective Equipment	5
I.3. In Case of Fire	5
I.4. Some Laboratory Hazards	6
I.5. Disposal of Chemicals	6
I.6. General Rules of Safe Laboratory Conduct	7

UNIT II : INTRODUCTION TO CHEMISTRY

II.1. Unit Conversions	9
II.2. SI Units	16
II.3. Metric Conversions	19
• Derived Quantities	23
II.4. Density	24
II.5. Significant Figures and Experimental Uncertainty	26
• Significant Figures	27
• How to Read a Scale	30
• Experimental Uncertainty	34

UNIT III : THE PHYSICAL PROPERTIES AND PHYSICAL CHANGES OF SUBSTANCES

III.1. Some Basic Definitions in Science	41
III.2. The Physical Properties of Matter	44
III.3. The Classification of Matter	49
III.4. The Physical Separation of Substances	53
III.5. Phase Changes	59
III.6. The Role Of Kinetic Energy in Physical Changes	62
• Practical Applications of Kinetic Energy Changes	63
• The Role of Kinetic Energy in Phase Changes	64

UNIT IV : INORGANIC NOMENCLATURE

IV.1. The Chemical Elements	65
IV.2. Naming Inorganic Compounds	67
• Naming Monatomic Ions	69
• Naming Polyatomic Ions	69
• Constructing the Formula of an ionic Compound, Given the Name of the Compound	70
• Constructing the Name of an Ionic Compound, Given the Formula of the Compound	71
• Naming Hydrates	72
• Naming Compounds by Using the Prefix–Naming System	73
• Some Common Acids	74
IV.3. Extension : The Colours of Some Common Aqueous Ions	75

UNIT V : THE MOLE CONCEPT

V.1.	Atomic Masses and Avogadro's Hypothesis	77
V.2.	The Mole	78
	• Finding the Molar Mass of a Compound	79
	• Calculations Relating the Number of Moles and the Mass of a Substance	81
	• Calculations Relating the Number of Moles and the Volume of a Gas	82
	• Calculations Relating the Number of Moles and the Number of Particles	83
V.3.	Multiple Conversions Between Moles, Mass, Volume and Number of Particles	85
V.4.	Percentage Composition	90
V.5.	Empirical and Molecular Formulae	91
	• Finding the Molecular Formula	93
V.6.	Molar Concentration	96
	• Making up Solutions	97
	• Dilution Calculations	99

UNIT VI : CHEMICAL REACTIONS

VI.1.	Introduction to Chemical Equations	105
VI.2.	The Conservation Laws	105
VI.3.	Balancing Chemical Reaction Equations	107
VI.4.	Writing Phases in Reaction Equations and Using Chemical Word Equations	113
VI.5.	Types of Chemical Reactions	114
VI.6.	Energy Changes in Chemical Reactions	119

UNIT VII : CALCULATIONS INVOLVING REACTIONS (STOICHIOMETRY)

VII.1.	The Meaning of the Coefficients in a Reaction Equation	123
VII.2.	Stoichiometry Calculations Involving Moles, Mass, Gas Volume and Molecules	125
VII.3.	Stoichiometry Calculations Involving Molar Concentration	129
VII.4.	Stoichiometry of Excess Quantities	132
VII.5.	Extension: Percentage Yield and Percentage Purity	134

UNIT VIII : ATOMS AND THE PERIODIC TABLE

VIII.1.	The Structure of the Atom	139
	A. Early Models of the Atom	139
	B. The Rutherford–Bohr Model of the Atom	142
	C. Atomic Number and Atomic Mass	144
	D. Isotopes	148
	E. Natural Mixtures of Isotopes	150
	F. The Electronic Structure of the Atom	151
VIII.2.	The Periodic Table	158
	A. Early Attempts to Organize the Elements: Mass Confusion	158
	B. The Modern Periodic Table	160
VIII.3.	Chemical Bonding	165
	A. The Electronic Nature of Chemical Bonding	165
	B. Types of Chemical Bonding	171
	C. Writing Lewis Structures	183
VIII.4.	Chemical Families	189
	A. The Noble Gases	189
	B. The Alkali Metals	189
	C. The Alkaline Earth Metals	190
	D. The Halogens	191

UNIT IX : SOLUTION CHEMISTRY

IX.1.	Solutions and Solubility	193
IX.2.	The Conductivity of Aqueous Solutions	195
IX.3.	Molecular Polarity	198
	A. Dipole–Dipole Forces	198
	B. Hydrogen Bonding	202
IX.4.	Polar and Nonpolar Solvents	204
IX.5.	The Nature of Solutions of Ions	209
IX.6.	Calculating the Concentrations of Ions in Solution	211

UNIT X : ORGANIC CHEMISTRY

X.1.	Introduction	213
X.2.	Alkanes	214
	A. Unbranched (“Straight Chain”) Alkanes	215
	B. Alkyl Groups and Branched Hydrocarbons	217
	C. Cycloalkanes	222
X.3.	Alkyl Halides	224
X.4.	Multiple Bonds (“Alkenes and Alkynes”)	226
X.5.	Aromatic Compounds	230
X.6.	Functional Groups	233
X.7.	Summary Exercises	242

Answers

Answers to Unit I : Safety In The Chemical Laboratory	247

V.6. MOLAR CONCENTRATION

This section is concerned with the idea of "concentration" and how to work with solutions of different concentrations. Everything in this section involves a simple idea: **knowing the concentration of a solution provides a way to find how much of a particular substance exists in a given volume of the solution.**

Definitions: The **CONCENTRATION** of a substance in solution is the amount of the substance which exists in a given volume of the solution.

A **CONCENTRATED** solution has a relatively high concentration. (There is a large amount of substance dissolved in the solution.)

A **DILUTE** solution has a relatively low concentration. (Very little substance is dissolved in the solution.)

NOTE: The terms "concentrated" and "dilute" are comparative and do not have precise meanings. Frequently, concentrated solutions are SATURATED solutions, or solutions with the "maximum possible concentration". Dilute solutions can be formed when large amounts of some solvent (normally water) are added to a concentrated solution in order to produce a lower concentration.

Chemists frequently use the "mole" to describe the amount of a substance in a solution.

Definition: The **MOLAR CONCENTRATION** or **MOLARITY** of a substance in solution is the number of moles of the substance contained in 1 L of **solution**.

Note: This definition refers to "1 L of SOLUTION", not "1 L of SOLVENT". For example, 1 L of a concentrated solution of KBr(aq) may contain 550 g of KBr and 825 mL of water.

EXAMPLE: If 2.0 L of solution contain 5.0 mol of NaCl, what is the molarity of the NaCl?

$$\text{molar concentration} = \frac{5.0 \text{ mol}}{2.0 \text{ L}} = 2.5 \frac{\text{mol}}{\text{L}}$$

- NOTES:**
1. The unit symbol for "mol/L" is "M".
 2. When expressed in words, the unit symbol "M" is written as "molar".
 3. The short-hand symbol for "molar concentration of ..." is a set of brackets: [...]

EXAMPLES: If a 1.0 L of solution contains 2.5 mol of NaCl, the molar concentration can be expressed in several equivalent ways (shown below).

$$\text{molar concentration of NaCl} = 2.5 \frac{\text{mol}}{\text{L}} = 2.5 \text{ M}$$

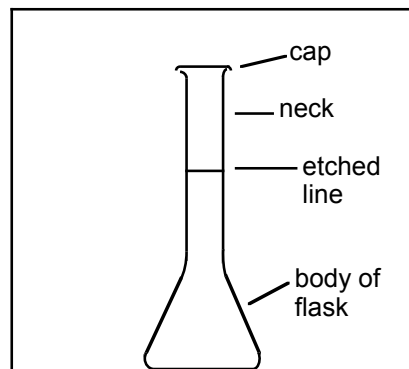

$$[\text{NaCl}] = 2.5 \text{ M}$$

The molarity of the sodium chloride is 2.5 molar.

MAKING UP SOLUTIONS

VOLUMETRIC FLASKS are used to obtain accurate volumes of solutions (see Figure 1, at right). Volumetric flasks are manufactured in specific volumes: 10 mL, 25 mL, 50 mL, 100 mL, 250 mL, 500 mL, 1000 mL, 2000 mL, etc. Generally, the volumes are accurate to about $\pm 0.1\%$. The following procedure is used for making up an aqueous solution.

Add the required amount of chemical to a flask having an appropriate volume. Then add distilled water until the flask is about one-half to two-thirds full. Cap the flask and shake it until the chemical has completely dissolved. Then add distilled water until the bottom of the meniscus (curved separation between water and air) just touches the etched line on the flask's neck (Figure 2). In order to get the last bit of water in accurately, it is advisable to use a small dropper. Finally, re-cap the flask and shake thoroughly until no wavy lines (resembling the heated air seen above a hot road) can be seen in the solution.

Typical volumetric flask

Figure 1**EXERCISES:**

56. You have been asked to make 1.000 L of 1.000 M NaCl solution. Why shouldn't you add 1.000 L of water first and then add the NaCl to be dissolved?
57. You are making up a solution and accidentally add a bit too much liquid, so that the liquid level is about 2 mm above the etched line on the neck of the volumetric flask. What should you do at this point?
58. What practical problems arise if a solution is not thoroughly mixed?

Aligning the meniscus

Figure 2

The definition of molar concentration leads directly to the equations below.

molar concentration = $\frac{\text{moles}}{\text{volume}}$	where: c = molar concentration, in mol/L
or: $c = \frac{n}{V}$	n = number of moles V = volume, in litres

EXAMPLE: What is the **[NaCl]** in a solution containing 5.12 g of NaCl in 250.0 mL of solution?

Plan: In order to find molarity (*c*), the moles (*n*) and volume (*V*) are needed. A volume is given and the mass given can be converted to moles.

$$\text{moles of NaCl} = 5.12 \text{ g} \times \frac{1 \text{ mol}}{58.5 \text{ g}} = 0.0875 \text{ mol}$$

$$\text{and: } [\text{NaCl}] = c = \frac{n}{V} = \frac{0.0875 \text{ mol}}{0.2500 \text{ L}} = \mathbf{0.350 \text{ M}}$$

EXAMPLE: What mass of NaOH is contained in 3.50 L of 0.200 M NaOH?

Plan: The molarity (c) and volume (V) are given so moles (n) can be found. Moles can then be converted to mass.

$$\text{Solving } c = \frac{n}{V} \text{ for } n \text{ gives } n = c \cdot V$$

$$\text{then: } \text{moles NaOH} = 0.200 \frac{\text{mol}}{\text{L}} \times 3.50 \text{ L} = 0.700 \text{ mol}$$

$$\text{and: } \text{mass NaOH} = 0.700 \text{ mol} \times \frac{40.0 \text{ g}}{1 \text{ mol}} = \mathbf{28.0 \text{ g}}$$

EXAMPLE: What is the molarity of pure sulphuric acid, H_2SO_4 , having a density of 1.839 g/mL?

Notice that density and molarity both have units of amount/volume

$$\text{where: } \text{density} = \frac{\text{amount (as mass)}}{\text{volume}} \quad \text{and} \quad \text{molarity} = \frac{\text{amount (as moles)}}{\text{volume}}$$

Therefore, a unit conversion can be used to convert from an amount expressed in "grams" to an amount expressed in "moles" (and vice versa).

$$[\text{H}_2\text{SO}_4] = \frac{1.839 \text{ g}}{0.001 \text{ L}} \times \frac{1 \text{ mol}}{98.1 \text{ g}} = \mathbf{18.7 \text{ M}}$$

EXAMPLE: What is the molarity of the CaCl_2 in a solution made by dissolving and diluting 15.00 g of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$ to 500.0 mL?

the moles of CaCl_2 produced equals the moles of $\text{CaCl}_2 \cdot 6\text{H}_2\text{O(s)}$ dissolved.

$$[\text{CaCl}_2] = [\text{CaCl}_2 \cdot 6\text{H}_2\text{O}] = \frac{15.00 \text{ g}}{0.5000 \text{ L}} \times \frac{1 \text{ mol}}{219.1 \text{ g}} = \mathbf{0.1369 \text{ M}}$$

EXERCISES:

59. Calculate the molar concentration of the following solutions.

(a) 0.26 mol of HCl in 1.0 L of solution	(d) 25.0 g of NaCl in 250.0 mL of solution
(b) 2.8 mol of HNO_3 in 4.0 L of solution	(e) 1.50 g of $\text{CoBr}_2 \cdot 6\text{H}_2\text{O}$ in 600.0 mL of solution
(c) 0.0700 mol of NH_4Cl in 50.0 mL of solution	(f) 10.0 g of $\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$ in 325 mL of solution
60. What is the actual experimental procedure you would use to prepare the following solutions?

(a) 1.00 L of 3.00 M NH_4Cl	(e) 2.75 L of 0.0120 M NaOH
(b) 500.0 mL of 0.250 M $\text{Hg}(\text{NO}_3)_2$	(f) 2.00 L of 0.0300 M CuSO_4 , starting with $\text{CuSO}_4 \cdot 5\text{H}_2\text{O(s)}$
(c) 125 mL of 0.500 M $\text{Ba}(\text{NO}_3)_2$	(g) 50.0 mL of 0.225 M BaI_2 , starting with $\text{BaI}_2 \cdot 2\text{H}_2\text{O(s)}$
(d) 250.0 mL of 0.100 M SbCl_3	
61. How many moles of AlCl_3 are contained in 350.0 mL of 0.250 M AlCl_3 ?
62. What volume of 2.40 M HCl can be made from 100.0 g of HCl?
63. How many moles of $\text{Sr}(\text{NO}_3)_2$ are contained in 55.0 mL of 1.30×10^{-3} M $\text{Sr}(\text{NO}_3)_2$?
64. What volume of 2.8×10^{-2} M NaF contains 0.15 g of NaF?
65. The density of water at 4°C is 1.000 kg/L. What is the molar concentration of H_2O in pure water at 4°C ? (Hint: how many moles of H_2O are contained in 1 L?)
66. The density of acetic acid, $\text{CH}_3\text{COOH(l)}$, is 1049 g/L. What is the molarity of pure acetic acid?

67. The molar concentration of pure $\text{HClO}_4(\text{l})$ is 17.6 M. What is the density of pure HClO_4 ?
68. The molarity of $\text{CS}_2(\text{l})$ is 16.6 M. What is the density of $\text{CS}_2(\text{l})$?
69. How many grams of CaCl_2 are contained in 225 mL of 0.0350 M CaCl_2 solution?
70. How many grams of Na_3PO_4 are contained in 3.45 L of 0.175 M $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$?
71. Acetone has a density of 0.790 g/mL. What mass of acetone and benzoic acid, $\text{C}_6\text{H}_5\text{COOH}$, is required to make 350.0 mL of a 0.0100 M solution of benzoic acid dissolved in acetone? Ignore the contribution which the benzoic acid makes to the volume. Based on your answer, why does it seem appropriate that you can ignore the contribution made by benzoic acid to the total volume?

DILUTION CALCULATIONS

The following set of exercises is designed to help you develop an intuitive approach to working with molarity calculations involving dilution and mixing of solutions. To make sure you don't get on the "wrong track", you should check each answer before proceeding to the next question or part of a question.

EXERCISES:

72. Assume you have been given a can of orange juice concentrate. Let:

concentration of juice in can = 1 OJ (1 orange juice unit) .

You are probably aware of the fact that mixing one can of concentrated orange juice with one can of water produces orange juice that is "one half of full strength", so that:

$$\text{diluted concentration} = \frac{1}{2} \text{ full strength} = \frac{1}{2} \text{ OJ} \quad (1 \text{ Orange Juice unit})$$

What diluted concentration, in OJ's, will you have if you mix

- one can of orange juice with two cans of water?
 - one can of orange juice with three cans of water?
 - one can of orange juice with nine cans of water?
 - two cans of orange juice with two cans of water?
 - two cans of orange juice with eight cans of water?
 - three cans of orange juice with five cans of water?
73. Summarize the results of exercise 72 by writing a general equation for the diluted concentration of orange juice produced by mixing **C** cans of concentrated orange juice and **W** cans of water.
74. Now let's pretend that you are not mixing concentrated orange juice with water, but instead are mixing concentrated orange juice with concentrated apple juice.

Let: concentration of apple juice = 1 AJ.

- Does the fact that you are now adding apple juice instead of water to the orange juice change the AMOUNT of orange juice already present? Is the total volume different when one can of orange juice is mixed into one can of apple juice instead of one can of water? Is the orange juice diluted more (or less) if apple juice is added instead of water?
- Let's change our viewpoint for a moment. Pretend we are now interested in how much the apple juice is being diluted, rather than how much the orange juice is diluted. Remembering that the concentration of the apple juice is 1 AJ, what is the diluted concentration of the apple juice when one can of apple juice is mixed with one can of orange juice?
- Separately calculate the diluted concentration of orange juice, in OJ's, and the diluted concentration of apple juice, in AJ's, when the following are mixed.
 - One can of orange juice is mixed with one can of apple juice.
 - One can of orange juice is mixed with two cans of apple juice.

- iii) One can of orange juice is mixed with three cans of apple juice.
 iv) Two cans of orange juice is mixed with three cans of apple juice.
 v) Five cans of orange juice is mixed with five cans of apple juice.
 vi) Four cans of orange juice is mixed with six cans of apple juice.
75. Summarize the results of exercise 74 by writing two general equations: one for the diluted concentration of orange juice and one for the diluted concentration of apple juice. Assume that **O** cans of orange juice and **A** cans of apple juice are mixed together.
76. How would you modify your equations in exercise 75 if the original concentrations were 0.8 OJ and 0.7 AJ instead of 1 OJ and 1 AJ?
77. OK, now we investigate the results of mixing two different brands of orange juice. El Cheapo Orange Drink Concentrate has a concentration which is 0.50 OJ. The other brand, Expensive Orange Juice Concentrate, has a concentration which is 1.0 OJ. **The mixing of the two different brands means the addition of the cans of one brand will DILUTE the concentration of the other brand, similar to the way that the apple juice and orange juice diluted each other.**
- Assume you mix TWO cans of El Cheapo (having a concentration of 0.50 OJ) with THREE cans of Expensive (having a concentration of 1.0 OJ).**
- a) What is the concentration of the El Cheapo orange juice, after mixing?
 b) What is the concentration of the Expensive orange juice, after mixing?
 c) What is the total concentration of orange juice, expressed in OJ's, in the mixture?
 d) What is the total concentration of orange juice produced when five cans of Expensive Concentrate is mixed with three cans of El Cheapo Concentrate?
 e) What is the total concentration of orange juice produced when four cans of Expensive Concentrate is mixed with seven cans of El Cheapo Concentrate?

Now that you have explored the deep mysteries of orange and apple juice, let's apply this knowledge to chemical solutions having concentrations measured in moles / litre.

When two solutions are mixed, the resulting mixture has a total volume and total number of moles equal to the sum of the individual volumes and individual numbers of moles of chemical found in the separate solutions.

In other words –

$\text{molarity of mixture} = \frac{\text{total moles of chemical in which we are interested}}{\text{total volume of mixture}}$

A. SIMPLE DILUTION OF A CHEMICAL IN SOLUTION

Assume: **initial concentration of solution** (in more concentrated form) = c_{CONC}
initial volume of solution (in more concentrated form) = V_{CONC}
diluted concentration (after water is added) = c_{DIL}
diluted volume (after water is added) = V_{DIL}

The "diluted volume" can also be thought of as the "total volume after dilution".

Since $c = \frac{n}{V}$ then $n = c \cdot V$

which means moles of chemical in concentrated solution = $n_{\text{CONC}} = c_{\text{CONC}} \times V_{\text{CONC}}$
 and moles of chemical in diluted solution = $n_{\text{DIL}} = c_{\text{DIL}} \times V_{\text{DIL}}$.

But the amount of the chemical is not changed when the solution is diluted, only the concentration of the chemical is changed. Therefore

moles of concentrated chemical = moles of diluted chemical

or: $n_{\text{CONC}} = n_{\text{DIL}}$

so that: $c_{\text{CONC}} \times V_{\text{CONC}} = n_{\text{CONC}} = n_{\text{DIL}} = c_{\text{DIL}} \times V_{\text{DIL}}$

FINAL EQUATION:

$$c_{\text{CONC}} \times V_{\text{CONC}} = c_{\text{DIL}} \times V_{\text{DIL}}$$

or

$$c_{\text{DIL}} = c_{\text{CONC}} \times \frac{V_{\text{CONC}}}{V_{\text{DIL}}}$$

Aha! Look at the second equation in the box, above. It is our “orange juice dilution equation”!

EXAMPLE: If 200.0 mL of 0.500 M NaCl is added to 300.0 mL of water, what is the resulting [NaCl] in the mixture?

Since [NaCl]_{DIL} and c_{DIL} have the same meaning, then

$$[\text{NaCl}]_{\text{DIL}} = [\text{NaCl}]_{\text{CONC}} \times \frac{V_{\text{CONC}}}{V_{\text{DIL}}} = 0.500 \text{ M} \times \frac{200.0 \text{ mL}}{(200.0 + 300.0) \text{ mL}} = \mathbf{0.200 \text{ M}}$$

B. MIXING TWO SOLUTIONS HAVING DIFFERENT CONCENTRATIONS OF THE SAME CHEMICAL

This is the equivalent problem to mixing El Cheapo orange juice and Expensive orange juice. One solution dilutes the other solution, and vice versa. In the calculations below, one solution is arbitrarily “#1” and the other “#2”. In order to get an accurate answer you must keep extra digits in the intermediate answers, rounding only the final answer to the correct number of significant digits.

Treat mixtures of two solutions as two separate “single dilutions” and then add the results of the individual single dilutions to get the overall concentration of the mixture as was done when mixing El Cheapo and Expensive brands of orange juice in exercise 77.

EXAMPLE: If 300.0 mL of 0.250 M NaCl is added to 500.0 mL of 0.100 M NaCl, what is the resulting [NaCl] in the mixture?

Arbitrarily, let solution #1 be 0.250 M NaCl and solution #2 be 0.100 M NaCl.

$$[\text{NaCl}]_{\text{DIL}} (\#1) = [\text{NaCl}]_{\text{CONC}} (\#1) \times \frac{V_{\text{CONC}} (\#1)}{V_{\text{DIL}}} = 0.250 \text{ M} \times \frac{300.0 \text{ mL}}{800.0 \text{ mL}} = 0.09375 \text{ M}$$

$$[\text{NaCl}]_{\text{DIL}} (\#2) = 0.100 \text{ M} \times \frac{500.0 \text{ mL}}{800.0 \text{ mL}} = 0.06250 \text{ M}$$

$$[\text{NaCl}] (\text{total}) = [\text{NaCl}]_{\text{DIL}} (\#1) + [\text{NaCl}]_{\text{DIL}} (\#2) = 0.09375 + 0.06250 = \mathbf{0.156 \text{ M}}$$

Note: The final concentration lies between the original concentrations of the two NaCl solutions: $0.100 \text{ M} < \mathbf{0.156 \text{ M}} < 0.250 \text{ M}$. Obviously the mixture’s concentration cannot be greater than the most concentrated solution involved or less than the least concentrated solution used.

C. MAKING DILUTE SOLUTIONS FROM CONCENTRATED SOLUTIONS

Again, this calculation is based on the fact that the moles of chemical in the diluted solution equals the moles of chemical poured from the concentrated solution. That is, $n_{\text{CONC}} = n_{\text{DIL}}$.

$$c_{\text{CONC}} \times V_{\text{CONC}} = c_{\text{DIL}} \times V_{\text{DIL}}$$

EXAMPLE: What volume of 6.00 M HCl is used in making up 2.00 L of 0.125 M HCl?

The equation: $c_{\text{CONC}} \times V_{\text{CONC}} = c_{\text{DIL}} \times V_{\text{DIL}}$

is rearranged to solve for the volume of concentrated solution required.

$$V_{\text{CONC}} = \frac{c_{\text{DIL}} \times V_{\text{DIL}}}{c_{\text{CONC}}} = \frac{0.125 \text{ M} \times 2.00 \text{ L}}{6.00 \text{ M}} = \mathbf{0.0417 \text{ L}}$$

EXAMPLE: A student mixes 100.0 mL of water with 25.0 mL of a sodium chloride solution having an unknown concentration. If the student finds the molarity of the sodium chloride in the diluted solution is 0.0876 M, what is the molarity of the original sodium chloride solution?

The diluted volume is $100.0 \text{ mL} + 25.0 \text{ mL} = 125.0 \text{ mL}$

$$\text{Therefore } c_{\text{CONC}} = c_{\text{DIL}} \times \frac{V_{\text{DIL}}}{V_{\text{CONC}}} = 0.0876 \text{ M} \times \frac{125.0 \text{ mL}}{25.0 \text{ mL}} = \mathbf{0.438 \text{ M}}$$

EXERCISES:

78. If 20.0 mL of 0.75 M HBr is diluted to a total volume of 90.0 mL, what is the molar concentration of the HBr in the resulting solution?
79. What is the molar concentration of the KOH solution resulting from mixing 55 mL of 0.15 M KOH and 75 mL of 0.25 M KOH?
80. If 1 drop (0.050 mL) of 0.20 M NaBr is added to 100.00 mL of water, what is the molarity of the NaBr in the resulting solution?
81. What is the molar concentration of the HNO₃ solution resulting from mixing 5.0 mL of 3.5 M HNO₃ and 95 mL of 0.20 M HNO₃?
82. Concentrated HNO₃ is 15.4 M. How would you prepare 2.50 L of 0.375 M HNO₃?
83. Concentrated H₃PO₄ is 14.6 M. How would you prepare 45.0 L of 0.0600 M H₃PO₄?
84. If 300.0 mL of solution A contains 25.0 g of KCl and 250.0 mL of solution B contains 60.0 g of KCl, what is the molarity of the KCl in the solution resulting from mixing solutions A and B?
85. If 500.0 mL of 0.750 M NaCl is boiled down until the final volume is reduced to 300.0 mL, what is the final molarity of the NaCl? (Assume no salt is lost during the boiling process.)
86. How would you prepare 250.0 mL of 0.350 M HCl, starting with 6.00 M HCl?
87. What mass of NaCl is needed to prepare 500.0 mL of 0.400 M NaCl?
88. What is the concentration of the NaOH solution produced by mixing 125.0 mL of 0.250 M NaOH with 200.0 mL of 0.175 M NaOH?
89. What volume of 12.0 M NaOH is required in order to prepare 3.00 L of 0.750 M NaOH?
90. What is the concentration of CaCl₂ produced when 55.0 mL of 0.300 M HCl is mixed with 80.0 mL of 0.550 M CaCl₂?

91. When 350.0 mL of 0.250 M MgCl_2 is boiled down to a final volume of 275.0 mL, what is the molarity of the MgCl_2 in the resulting solution?
92. If 20.0 mL of 0.350 M NaCl and 75.0 mL of 0.875 M NaCl are mixed and the resulting solution is boiled down to a volume of 60.0 mL, what is the molarity of the NaCl in the final solution?
93. A solution is made by mixing 100.0 mL of 0.200 M BaCl_2 and 150.0 mL of 0.400 M NaCl . What is the concentration of sodium chloride in the final solution?
94. If 75.0 mL of 0.200 M Na_3PO_4 is added to 25.0 mL of 0.800 M K_3PO_4 , what is the concentration of Na_3PO_4 in the mixture?

AN OVERVIEW OF MOLARITY PROBLEMS

The 5 basic types of molarity problems and the equations relevant to the problems are shown below.

A. Making a solution with a given concentration

$$c = \frac{n}{V}, \text{ where } n = \text{mass (g)} \times \frac{1 \text{ mol}}{\text{molar mass (g)}}$$

You may also be given moles (or mass) and concentration, and be asked to find the volume, or some variation of this problem.

B. Dilution of a single solution

$$c_{\text{DIL}} = c_{\text{CONC}} \times \frac{V_{\text{CONC}}}{V_{\text{DIL}}}$$

C. Mixing two solutions

$$c_{\text{DIL}} (\#1) = c_{\text{CONC}} (\#1) \times \frac{V_{\text{CONC}} (\#1)}{V_{\text{DIL}}} \quad \text{and} \quad c_{\text{DIL}} (\#2) = c_{\text{CONC}} (\#2) \times \frac{V_{\text{CONC}} (\#2)}{V_{\text{DIL}}}$$

$$c (\text{total}) = c_{\text{DIL}} (\#1) + c_{\text{DIL}} (\#2)$$

D. Converting a density to a molarity and vice versa

$$c = d \frac{(\text{g})}{(\text{L})} \times \frac{1 \text{ mol}}{\text{molar mass (g)}} \quad \text{and} \quad d = c \frac{(\text{mol})}{(\text{L})} \times \frac{\text{molar mass (g)}}{1 \text{ mol}}$$

E. Making a dilute solution from a concentrated solution

$$c_{\text{CONC}} \times V_{\text{CONC}} = c_{\text{DIL}} \times V_{\text{DIL}}$$

(Note that this is essentially the same as type B, above.)

MOLARITY REVIEW PROBLEMS

95. What is the molarity of each of the following solutions?
 - (a) 5.62 g of NaHCO_3 is dissolved in enough water to make 250.0 mL
 - (b) 184.6 mg of K_2CrO_4 is dissolved in enough water to make 500.0 mL
 - (c) 0.584 g of oxalic acid ($\text{H}_2\text{C}_2\text{O}_4$) is diluted to 100.0 mL
96. What is the actual experimental procedure you would use to make
 - (a) 1.00 L of 0.100 M NaCl , starting with solid NaCl ?
 - (b) 250.0 mL of 0.09000 M KBr , starting with solid KBr ?
 - (c) 500.0 mL of 0.125 M $\text{Ca}(\text{NO}_3)_2$, starting with solid $\text{Ca}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$?

97. What is the concentration of the solution produced when
- (a) 125 mL of 3.55 M LiOH is mixed with 475 mL of 2.42 M LiOH?
 - (b) 150.0 mL of water is added to 200.0 mL of 0.250 M NaCl?
 - (c) 100.0 mL of 12.0 M KBr is mixed with 950.0 mL of 0.200 M KBr?
 - (d) 75 mL of water is mixed with 5.0 mL of 2.50 M KBr?
 - (e) 50.0 mL of water is mixed with 850.0 mL of 0.1105 M HCl?
 - (f) 50.0 mL of 0.125 M HCl is mixed with 75.0 mL of 0.350 M HCl?
98. What is the molarity of the solution produced when
- (a) 250.0 mL of 0.750 M KBr is boiled down to a volume of 175.0 mL?
 - (b) 350.0 mL of water and 75.0 mL of 0.125 M NaNO₃ are mixed and boiled down to 325.0 mL?
 - (c) 150.0 mL of 0.325 M LiBr and 225.0 mL of 0.500 M LiBr are mixed and boiled to 275.0 mL?
99. What mass of solid solute is present in
- (a) 5.0 L of 2.5 M KBr?
 - (b) 225 mL of 0.135 M MgI₂?
 - (c) 350.0 mL of 0.250 M NaCl?
100. What is the molarity of the following pure liquids?
- (a) C₈H₁₈, d = 0.7025 g/mL
 - (b) CH₃COCH₃, d = 789.9 g/L
 - (c) POCl₃, d = 1.675 g/mL
101. What is the density of the following pure liquids?
- (a) SbF₅, molarity = 13.8 M
 - (b) S₂Cl₂, molarity = 12.73 M
 - (c) C₆H₅CHO, molarity = 9.825 M
102. (a) What volume of 3.00 M HCl is required to make up 5.00 L of 0.250 M HCl?
- (b) What volume of 15.4 M HNO₃ is needed to make up 500.0 mL of 0.100 M HNO₃?
- (c) What volume of 0.150 M HCl can be made from 250.0 mL of 5.00 M HCl?
- (d) What concentration of NaCl solution is made by diluting 3.00 L of 0.850 M NaCl to 12.5 L?
- (e) A solution is made in such a way that when 100.0 mL of the solution is diluted to 5.00 L, the resulting mixture has a concentration of 0.100 M. What is the molarity of the original solution?
- (f) What mass of KBr is contained in 500.0 mL of 0.235 M KBr?
- (g) What volume of 0.550 M HCl contains 50.0 g of HCl?
- (h) How many moles of LiCl are contained in 5.50 L of 0.850 M LiCl?
- (i) What is the concentration of CaCl₂ produced when 75.0 g of CaCl₂ is diluted to 950.0 mL?
- (j) What is the density of pure liquid CHBr₃ (molarity = 11.4 M)?
- (k) What volume of 0.0675 M Ba(NO₃)₂ contains 2.55 g of Ba(NO₃)₂?
- (l) How many moles of FeCl₃ are contained in 1.50 L of 0.368 M FeCl₃?
- (m) What is the molarity of SnCl₂ produced when 25.00 g of SnCl₂•2H₂O is diluted to 750.0 mL?
- (n) What volume of 0.995 M HCl is required to make 3.50 L of 0.0450 M HCl?
- (o) What is the molarity of NaCl made by mixing 185.0 mL of water with 55.0 mL of 0.543 M NaCl?
- (p) What mass of BaCl₂•2H₂O is required to make up 1.35 L of 0.250 M BaCl₂?
- (q) What is the concentration of CaCl₂ produced by mixing 145 mL of 0.550 M CaCl₂ with 55 mL of 0.135 M CaCl₂?
- (r) What is the molarity of pure liquid C₆H₆ (d = 0.8787 g/mL)?

54. empirical mass = 14.0 g

$$\text{density} = \frac{0.938 \text{ g}}{0.500 \text{ L}} = 1.876 \text{ g/L} \quad \text{and} \quad \text{mass of 1 mol} = 1.876 \frac{\text{g}}{\text{L}} \times 22.4 \text{ L} = 42.0 \text{ g}$$

$$N = \frac{42.0 \text{ g}}{14.0 \text{ g}} = 3.0 \quad \text{and} \quad \text{molecular formula} = 3 \times (\text{CH}_2) = \mathbf{C_3H_6}$$

55. empirical mass = 16.0 g ; molar mass = 3 x 16.0 g = 48.0 g

$$N = \frac{48.0 \text{ g}}{16.0 \text{ g}} = 3.0 \quad \text{and} \quad \text{molecular formula} = 3 \times (\text{O}) = \mathbf{O_3}$$

56. The total volume of water plus dissolved salt would be greater than 1.000 L.

57. Ask for instructions regarding disposal of the solution. There is no quick way to "save" the solution and be sure of the concentration.

58. When pouring samples from the volumetric flask, some of the samples will have different concentrations from other samples. The samples taken from the top of the flask will be less concentrated than those taken from the bottom.

59. (a) $[\text{HCl}] = \frac{0.26 \text{ mol}}{1.0 \text{ L}} = \mathbf{0.26 \text{ M}}$

(b) $[\text{HNO}_3] = \frac{2.8 \text{ mol}}{4.0 \text{ L}} = \mathbf{0.70 \text{ M}}$

(c) $[\text{NH}_4\text{Cl}] = \frac{0.0700 \text{ mol}}{0.0500 \text{ L}} = \mathbf{1.40 \text{ M}}$

(d) $[\text{NaCl}] = \frac{25.0 \text{ g}}{0.2500 \text{ L}} \times \frac{1 \text{ mol}}{58.5 \text{ g}} = \mathbf{1.71 \text{ M}}$

(e) $[\text{CoBr}_2 \cdot 6\text{H}_2\text{O}] = \frac{1.50 \text{ g}}{0.6000 \text{ L}} \times \frac{1 \text{ mol}}{326.7 \text{ g}} = \mathbf{0.00765 \text{ M}}$

(f) $[\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}] = \frac{10.0 \text{ g}}{0.325 \text{ L}} \times \frac{1 \text{ mol}}{400.0 \text{ g}} = \mathbf{0.0769 \text{ M}}$

60. (a) moles $\text{NH}_4\text{Cl} = 3.00 \frac{\text{mol}}{\text{L}} \times 1.00 \text{ L} = 3.00 \text{ mol}$

$$\text{mass NH}_4\text{Cl} = 3.00 \text{ mol} \times \frac{53.5 \text{ g}}{1 \text{ mol}} = 161 \text{ g}$$

Dissolve 161 g of NH_4Cl in less than 1.00 L of water and dilute to 1.00 L.

(b) moles $\text{Hg}(\text{NO}_3)_2 = 0.250 \frac{\text{mol}}{\text{L}} \times 0.5000 \text{ L} = 0.125 \text{ mol}$

$$\text{mass Hg}(\text{NO}_3)_2 = 0.125 \text{ mol} \times \frac{324.6 \text{ g}}{1 \text{ mol}} = 40.6 \text{ g}$$

Dissolve 40.6 g of $\text{Hg}(\text{NO}_3)_2$ in less than 500 mL of water and dilute to 500.0 mL.

(c) moles $\text{Ba}(\text{NO}_3)_2 = 0.500 \frac{\text{mol}}{\text{L}} \times 0.125 \text{ L} = 0.0625 \text{ mol}$

$$\text{mass Ba}(\text{NO}_3)_2 = 0.0625 \text{ mol} \times \frac{261.3 \text{ g}}{1 \text{ mol}} = 16.3 \text{ g}$$

Dissolve 16.3 g of $\text{Ba}(\text{NO}_3)_2$ in less than 125 mL of water and dilute to 125 mL.

$$(d) \text{ moles SbCl}_3 = 0.100 \frac{\text{mol}}{\text{L}} \times 0.2500 \text{ L} = 0.0250 \text{ mol}$$

$$\text{mass SbCl}_3 = 0.0250 \text{ mol} \times \frac{228.3 \text{ g}}{1 \text{ mol}} = 5.71 \text{ g}$$

Dissolve 5.71 g of SbCl_3 in less than 250 mL of water and then dilute to 250 mL.

$$(e) \text{ moles NaOH} = 0.0120 \frac{\text{mol}}{\text{L}} \times 2.75 \text{ L} = 0.0330 \text{ mol}$$

$$\text{mass NaOH} = 0.0330 \text{ mol} \times \frac{40.0 \text{ g}}{1 \text{ mol}} = 1.32 \text{ g}$$

Dissolve 1.32 g of NaOH in less than 2.75 L of water and then dilute to 2.75 L.

$$(f) \text{ moles CuSO}_4 \cdot 5\text{H}_2\text{O} = \text{moles CuSO}_4 = 0.0300 \frac{\text{mol}}{\text{L}} \times 2.00 \text{ L} = 0.0600 \text{ mol}$$

$$\text{mass CuSO}_4 \cdot 5\text{H}_2\text{O} = 0.0600 \text{ mol} \times \frac{249.6 \text{ g}}{1 \text{ mol}} = 15.0 \text{ g}$$

Dissolve 15.0 g of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ in less than 2.00 L of water and then dilute to 2.00 L.

$$(g) \text{ moles BaI}_2 \cdot 2\text{H}_2\text{O} = \text{moles BaI}_2 = 0.225 \frac{\text{mol}}{\text{L}} \times 0.0500 \text{ L} = 0.01125 \text{ mol}$$

$$\text{mass BaI}_2 \cdot 2\text{H}_2\text{O} = 0.01125 \text{ mol} \times \frac{427.1 \text{ g}}{1 \text{ mol}} = 4.80 \text{ g}$$

Dissolve 4.80 g of $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$ in less than 50.0 mL of water and then dilute to 50.0 mL.

$$61. \text{ moles AlCl}_3 = 0.250 \frac{\text{mol}}{\text{L}} \times 0.3500 \text{ L} = \mathbf{0.0875 \text{ M}}$$

$$62. \text{ moles HCl} = 100.0 \text{ g} \times \frac{1 \text{ mol}}{36.5 \text{ g}} = 2.74 \text{ mol}$$

$$c = \frac{n}{V}, \text{ so } V = \frac{n}{c} = \frac{2.74 \text{ mol}}{2.40 \text{ mol/L}} = \mathbf{1.14 \text{ L}}$$

$$63. \text{ moles Sr(NO}_3)_2 = 1.30 \times 10^{-3} \frac{\text{mol}}{\text{L}} \times 0.0550 \text{ L} = \mathbf{7.15 \times 10^{-5} \text{ mol}}$$

$$64. \text{ moles NaF} = 0.15 \text{ g} \times \frac{1 \text{ mol}}{42.0 \text{ g}} = 3.57 \times 10^{-3} \text{ mol}$$

$$c = \frac{n}{V}, \text{ so } V = \frac{n}{c} = \frac{3.57 \times 10^{-3} \text{ mol}}{2.8 \times 10^{-2} \text{ mol/L}} = \mathbf{0.13 \text{ L}}$$

$$65. [\text{H}_2\text{O}] = 1000 \frac{\text{g}}{\text{L}} \times \frac{1 \text{ mol}}{18.0 \text{ g}} = \mathbf{55.6 \text{ M}}$$

$$66. [\text{CH}_3\text{COOH}] = 1049 \frac{\text{g}}{\text{L}} \times \frac{1 \text{ mol}}{60.0 \text{ g}} = \mathbf{17.5 \text{ M}}$$

$$67. d = 17.6 \frac{\text{mol}}{\text{L}} \times \frac{100.5 \text{ g}}{1 \text{ mol}} = \mathbf{1.77 \times 10^3 \frac{\text{g}}{\text{L}}}$$

$$68. d = 16.6 \frac{\text{mol}}{\text{L}} \times \frac{76.2 \text{ g}}{1 \text{ mol}} = \mathbf{1.26 \times 10^3 \frac{\text{g}}{\text{L}}}$$

$$69. \text{ moles CaCl}_2 = 0.0350 \frac{\text{mol}}{\text{L}} \times 0.225 \text{ L} = 7.88 \times 10^{-3} \text{ mol}$$

$$\text{mass} = 7.88 \times 10^{-3} \text{ mol} \times \frac{111.1 \text{ g}}{1 \text{ mol}} = \mathbf{0.875 \text{ g}}$$

$$70. \text{ moles Na}_3\text{PO}_4 = \text{moles Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O} = 0.175 \frac{\text{mol}}{\text{L}} \times 3.45 \text{ L} = 0.604 \text{ mol}$$

$$\text{mass Na}_3\text{PO}_4 = 0.604 \text{ mol} \times \frac{164.0 \text{ g}}{1 \text{ mol}} = \mathbf{99.0 \text{ g}}$$

$$71. \text{ moles C}_6\text{H}_5\text{COOH} = 0.0100 \frac{\text{mol}}{\text{L}} \times 0.3500 \text{ L} = 3.50 \times 10^{-3} \text{ mol}$$

$$\text{mass C}_6\text{H}_5\text{COOH} = 3.50 \times 10^{-3} \text{ mol} \times \frac{122.0 \text{ g}}{1 \text{ mol}} = \mathbf{0.427 \text{ g}}$$

Now to find the mass of the acetone. Since $d = \frac{m}{V}$, then $m = d \cdot V$

$$\text{and mass acetone} = 0.790 \frac{\text{g}}{\text{mL}} \times 350.0 \text{ mL} = \mathbf{277 \text{ g}}$$

Since the volume of solvent used was 350 mL (about a "pop-can-full"), the addition of less than half a gram of solid (about a "pinch") would not appreciably change the volume.

$$72. \text{ (a) } \frac{1}{3} \text{ OJ} \quad \text{(b) } \frac{1}{4} \text{ OJ} \quad \text{(c) } \frac{1}{10} \text{ OJ} \quad \text{(d) } \frac{2}{4} \text{ OJ} = \frac{1}{2} \text{ OJ} \quad \text{(e) } \frac{1}{5} \text{ OJ} \quad \text{(f) } \frac{3}{8} \text{ OJ}$$

$$73. \text{ diluted concentration} = \frac{\mathbf{C}}{\mathbf{C + W}} \text{ OJ}$$

74. (a) The amount of orange juice is not changed and the total volume is unchanged from that produced when water is used instead of apple juice. Therefore the orange juice is diluted to the same extent, regardless of whether apple juice or water is added.

$$\text{(b) diluted concentration of apple juice} = \frac{1}{2} \text{ AJ}$$

$$\text{(c) i) diluted orange} = \frac{1}{2} \text{ OJ}; \text{ diluted apple} = \frac{1}{2} \text{ AJ}$$

$$\text{ii) diluted orange} = \frac{1}{3} \text{ OJ}; \text{ diluted apple} = \frac{2}{3} \text{ AJ}$$

$$\text{iii) diluted orange} = \frac{1}{4} \text{ OJ}; \text{ diluted apple} = \frac{3}{4} \text{ AJ}$$

$$\text{iv) diluted orange} = \frac{2}{5} \text{ OJ}; \text{ diluted apple} = \frac{3}{5} \text{ AJ}$$

$$\text{v) diluted orange} = \frac{1}{2} \text{ OJ}; \text{ diluted apple} = \frac{1}{2} \text{ AJ}$$

$$\text{vi) diluted orange} = \frac{2}{5} \text{ OJ}; \text{ diluted apple} = \frac{3}{5} \text{ AJ}$$

$$75. \text{ diluted orange} = \frac{\mathbf{O}}{\mathbf{O + A}} \text{ OJ}; \text{ diluted apple} = \frac{\mathbf{A}}{\mathbf{O + A}} \text{ AJ}$$

$$76. \text{ diluted orange} = \frac{\mathbf{O}}{\mathbf{O + A}} \times 0.8 \text{ OJ}; \text{ diluted apple} = \frac{\mathbf{A}}{\mathbf{O + A}} \times 0.7 \text{ AJ}$$

77. (a) diluted El Cheapo = $\frac{2}{5} \times 0.5 \text{ OJ} = 0.20 \text{ OJ}$
 (b) diluted Expensive = $\frac{3}{5} \times 1.0 \text{ OJ} = 0.60 \text{ OJ}$
 (c) total concentration = $0.20 \text{ OJ} + 0.60 \text{ OJ} = 0.80 \text{ OJ}$
 (d) total concentration = $\frac{5}{8} \times 1.0 \text{ OJ} + \frac{3}{8} \times 0.50 \text{ OJ} = 0.81 \text{ OJ}$
 (e) total concentration = $\frac{4}{11} \times 1.0 \text{ OJ} + \frac{7}{11} \times 0.50 \text{ OJ} = 0.68 \text{ OJ}$
78. $[\text{HBr}] = 0.75 \text{ M} \times \frac{20.0 \text{ mL}}{90.0 \text{ mL}} = \mathbf{0.17 \text{ M}}$
79. $[\text{KOH}]_{\text{DIL}} (\#1) = 0.15 \text{ M} \times \frac{55 \text{ mL}}{130 \text{ mL}} = 0.063 \text{ M}$
 $[\text{KOH}]_{\text{DIL}} (\#2) = 0.25 \text{ M} \times \frac{75 \text{ mL}}{130 \text{ mL}} = 0.14 \text{ M}$
 $[\text{KOH}] (\text{total}) = 0.063 + 0.14 = \mathbf{0.21 \text{ M}}$
80. $[\text{NaBr}] = 0.20 \text{ M} \times \frac{0.050 \text{ mL}}{100.05 \text{ mL}} = \mathbf{1.0 \times 10^{-4} \text{ M}}$
81. $[\text{HNO}_3]_{\text{DIL}} (\#1) = 3.5 \text{ M} \times \frac{5.0 \text{ mL}}{100 \text{ mL}} = 0.18 \text{ M}$
 $[\text{HNO}_3]_{\text{DIL}} (\#2) = 0.20 \text{ M} \times \frac{95 \text{ mL}}{100 \text{ mL}} = 0.19 \text{ M}$
 $[\text{HNO}_3] (\text{total}) = 0.18 + 0.19 = \mathbf{0.37 \text{ M}}$
82. $V_{\text{CONC}} = \frac{c_{\text{DIL}} \times V_{\text{DIL}}}{c_{\text{CONC}}} = \frac{0.375 \text{ M} \times 2.50 \text{ L}}{15.4 \text{ M}} = 0.0609 \text{ L}$
 Dilute 0.0609 L of concentrated HNO_3 to a total volume of 2.50 L.
83. $V_{\text{CONC}} = \frac{c_{\text{DIL}} \times V_{\text{DIL}}}{c_{\text{CONC}}} = \frac{0.0600 \text{ M} \times 45.0 \text{ L}}{14.6 \text{ M}} = 0.185 \text{ L}$
 Dilute 0.185 L of concentrated H_3PO_4 to a total volume of 45.0 L.
84. $[\text{KCl}] = \frac{\text{total moles}}{\text{total volume}}$, total mass $\text{KCl} = 25.0 + 60.0 = 85.0 \text{ g}$
 $[\text{KCl}] = \frac{85.0 \text{ g}}{0.5500 \text{ L}} \times \frac{1 \text{ mol}}{74.6 \text{ g}} = \mathbf{2.07 \text{ M}}$
85. $[\text{NaCl}] = 0.750 \text{ M} \times \frac{500.0 \text{ mL}}{300.0 \text{ mL}} = \mathbf{1.25 \text{ M}}$
86. $V_{\text{CONC}} = \frac{c_{\text{DIL}} \times V_{\text{DIL}}}{c_{\text{CONC}}} = \frac{0.350 \text{ M} \times 0.2500 \text{ L}}{6.00 \text{ M}} = 0.0146 \text{ L} = 14.6 \text{ mL}$
 Dilute 14.6 mL of concentrated HCl to a total volume of 250.0 mL.
87. moles NaCl needed = $0.400 \frac{\text{mol}}{\text{L}} \times 0.5000 \text{ L} = 0.200 \text{ mol}$
 mass $\text{NaCl} = 0.200 \text{ mol} \times \frac{58.5 \text{ g}}{1 \text{ mol}} = \mathbf{11.7 \text{ g}}$

88. $[\text{NaOH}]_{\text{DIL}} (\#1) = 0.250 \text{ M} \times \frac{125.0 \text{ mL}}{325.0 \text{ mL}} = 0.0962 \text{ M}$
 $[\text{NaOH}]_{\text{DIL}} (\#2) = 0.175 \text{ M} \times \frac{200.0 \text{ mL}}{325.0 \text{ mL}} = 0.108 \text{ M}$
 $[\text{NaOH}] (\text{total}) = 0.0962 + 0.108 = \mathbf{0.204 \text{ M}}$
89. $V_{\text{CONC}} = \frac{c_{\text{DIL}} \times V_{\text{DIL}}}{c_{\text{CONC}}} = \frac{0.750 \text{ M} \times 3.00 \text{ L}}{12.0 \text{ M}} = \mathbf{0.188 \text{ L}}$
90. $[\text{CaCl}_2] = 0.550 \text{ M} \times \frac{80.0 \text{ mL}}{135.0 \text{ mL}} = \mathbf{0.326 \text{ M}}$
91. $[\text{MgCl}_2] = 0.250 \text{ M} \times \frac{350.0 \text{ mL}}{275.0 \text{ mL}} = \mathbf{0.318 \text{ M}}$
92. $[\text{NaCl}]_{\text{DIL}} (\#1) = 0.350 \text{ M} \times \frac{20.0 \text{ mL}}{60.0 \text{ mL}} = 0.117 \text{ M}$
 $[\text{NaCl}]_{\text{DIL}} (\#2) = 0.875 \text{ M} \times \frac{75.0 \text{ mL}}{60.0 \text{ mL}} = 1.09 \text{ M}$
 $[\text{NaCl}] (\text{total}) = 0.117 \text{ M} + 1.09 \text{ M} = \mathbf{1.21 \text{ M}}$
93. $[\text{NaCl}] = 0.400 \text{ M} \times \frac{150.0 \text{ mL}}{250.0 \text{ mL}} = \mathbf{0.240 \text{ M}}$
