Desafíos nivel **PRINCIPIANTE**

Un barco

es capaz de flotar en el agua que utiliza para **navegar** como medio de transporte.

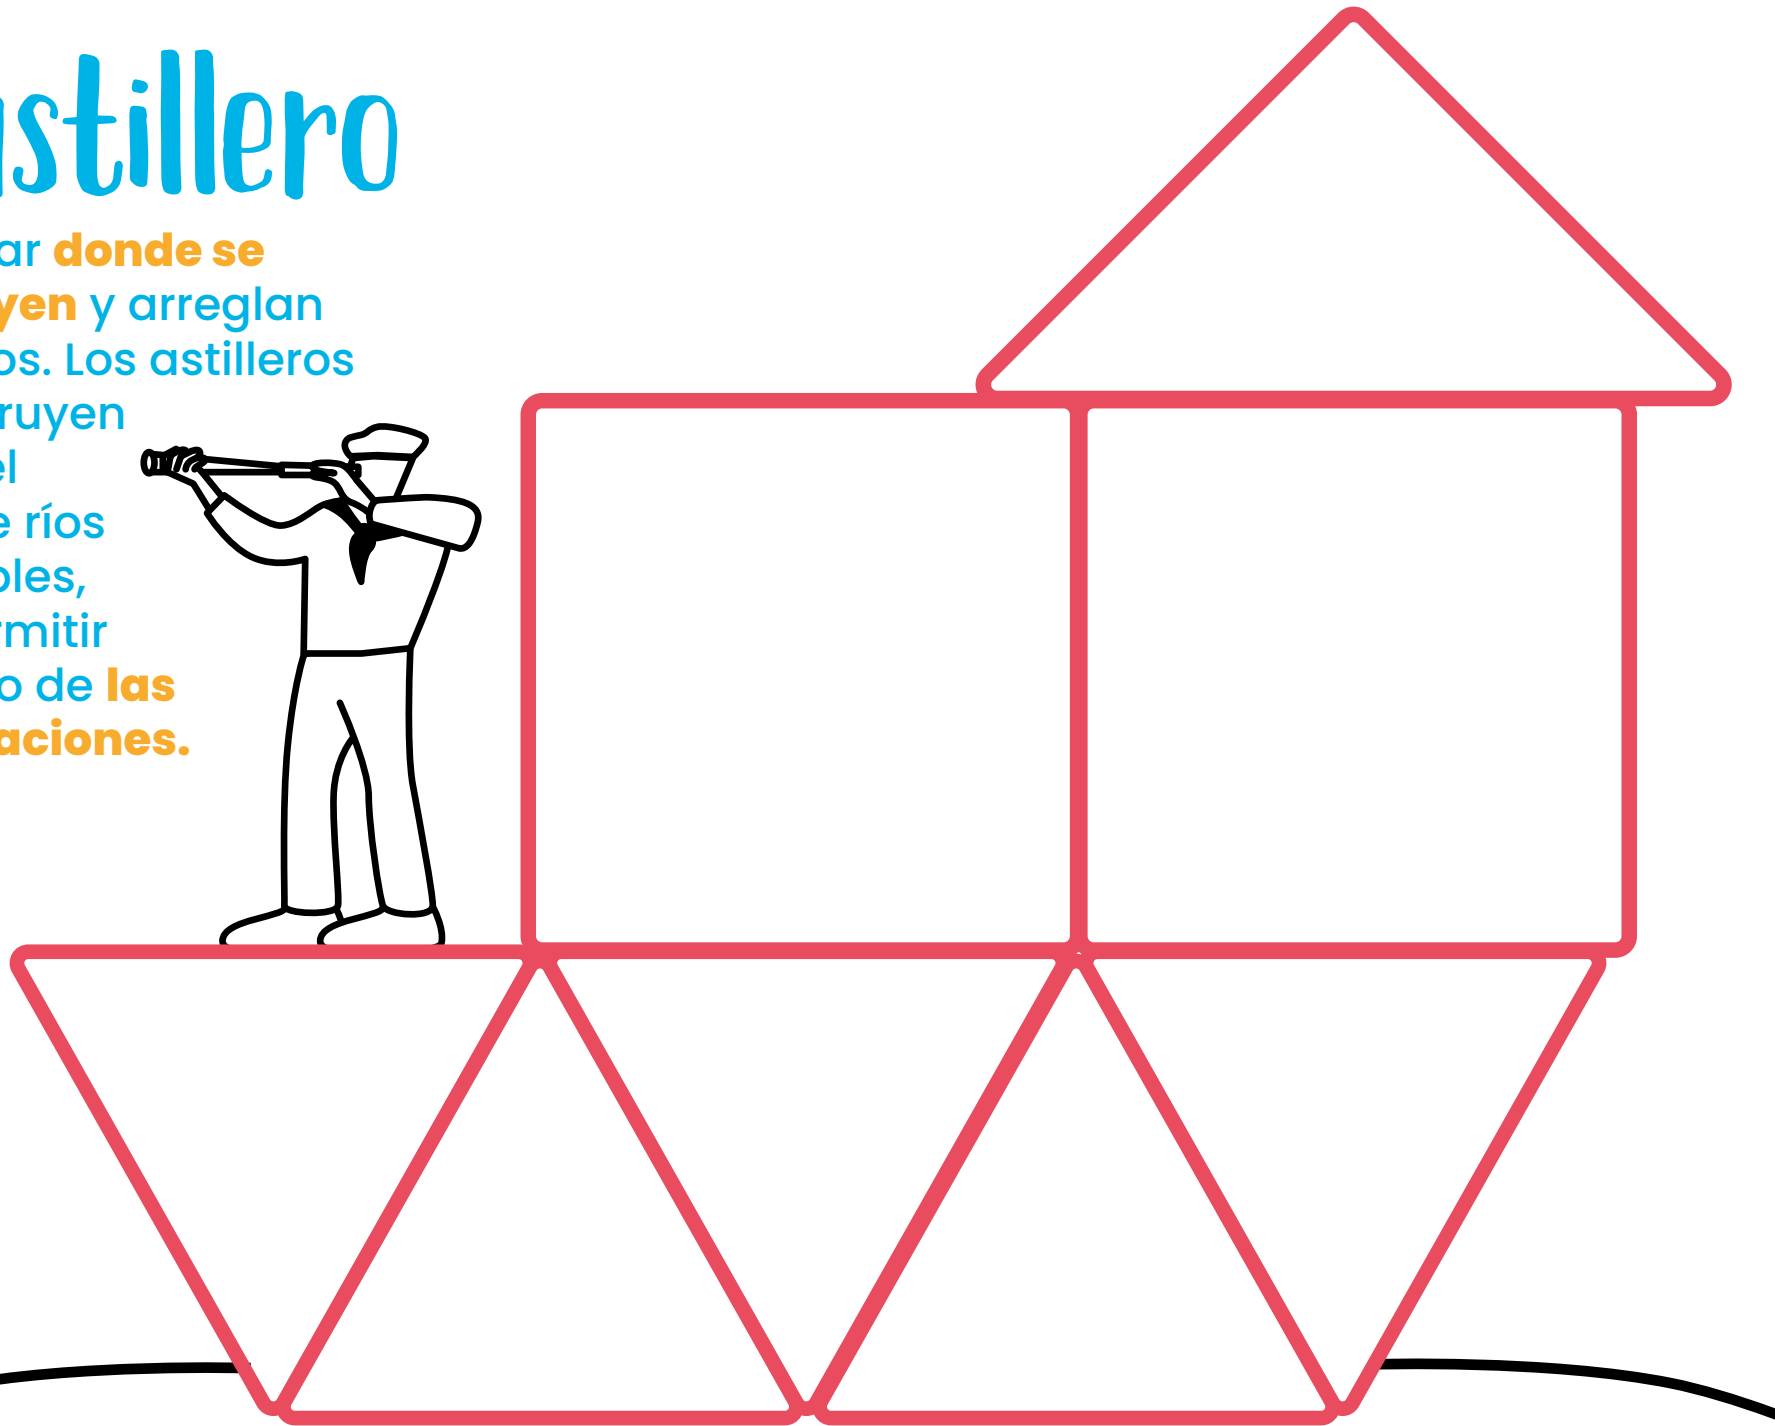

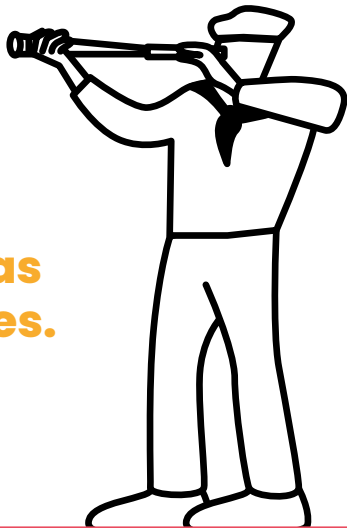

Existen diferentes tipos y nombres de embarcaciones. Según su tamaño, número de velas y otras características, reciben su nombre.

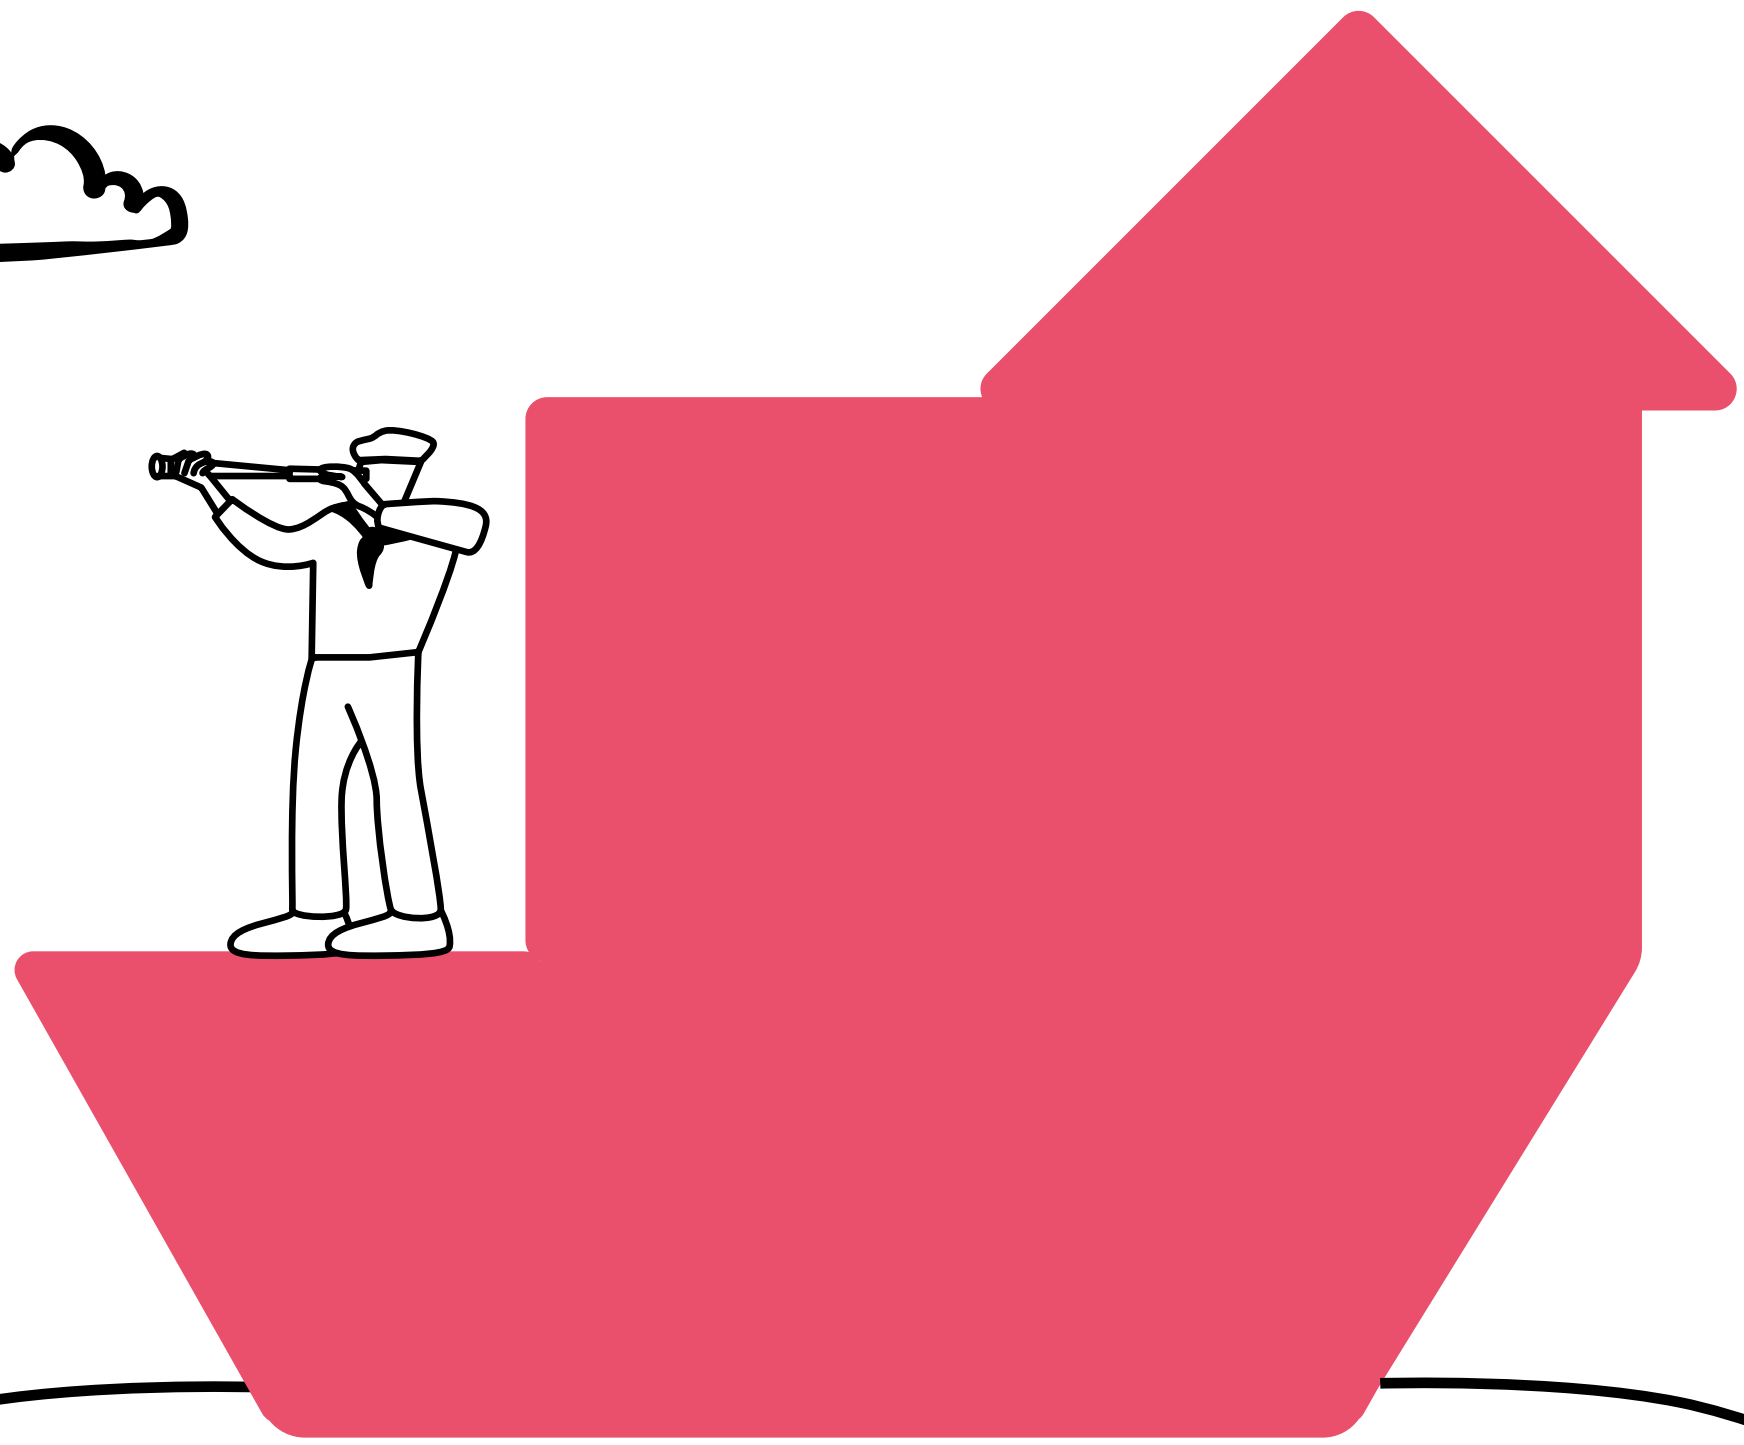

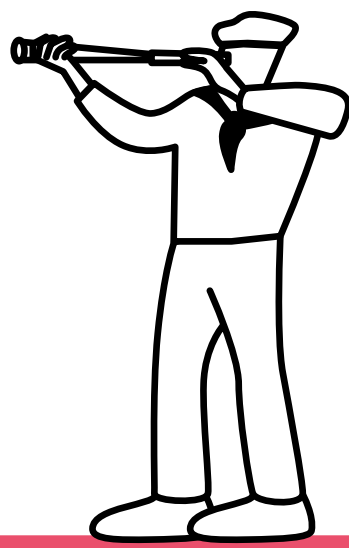

El astillero

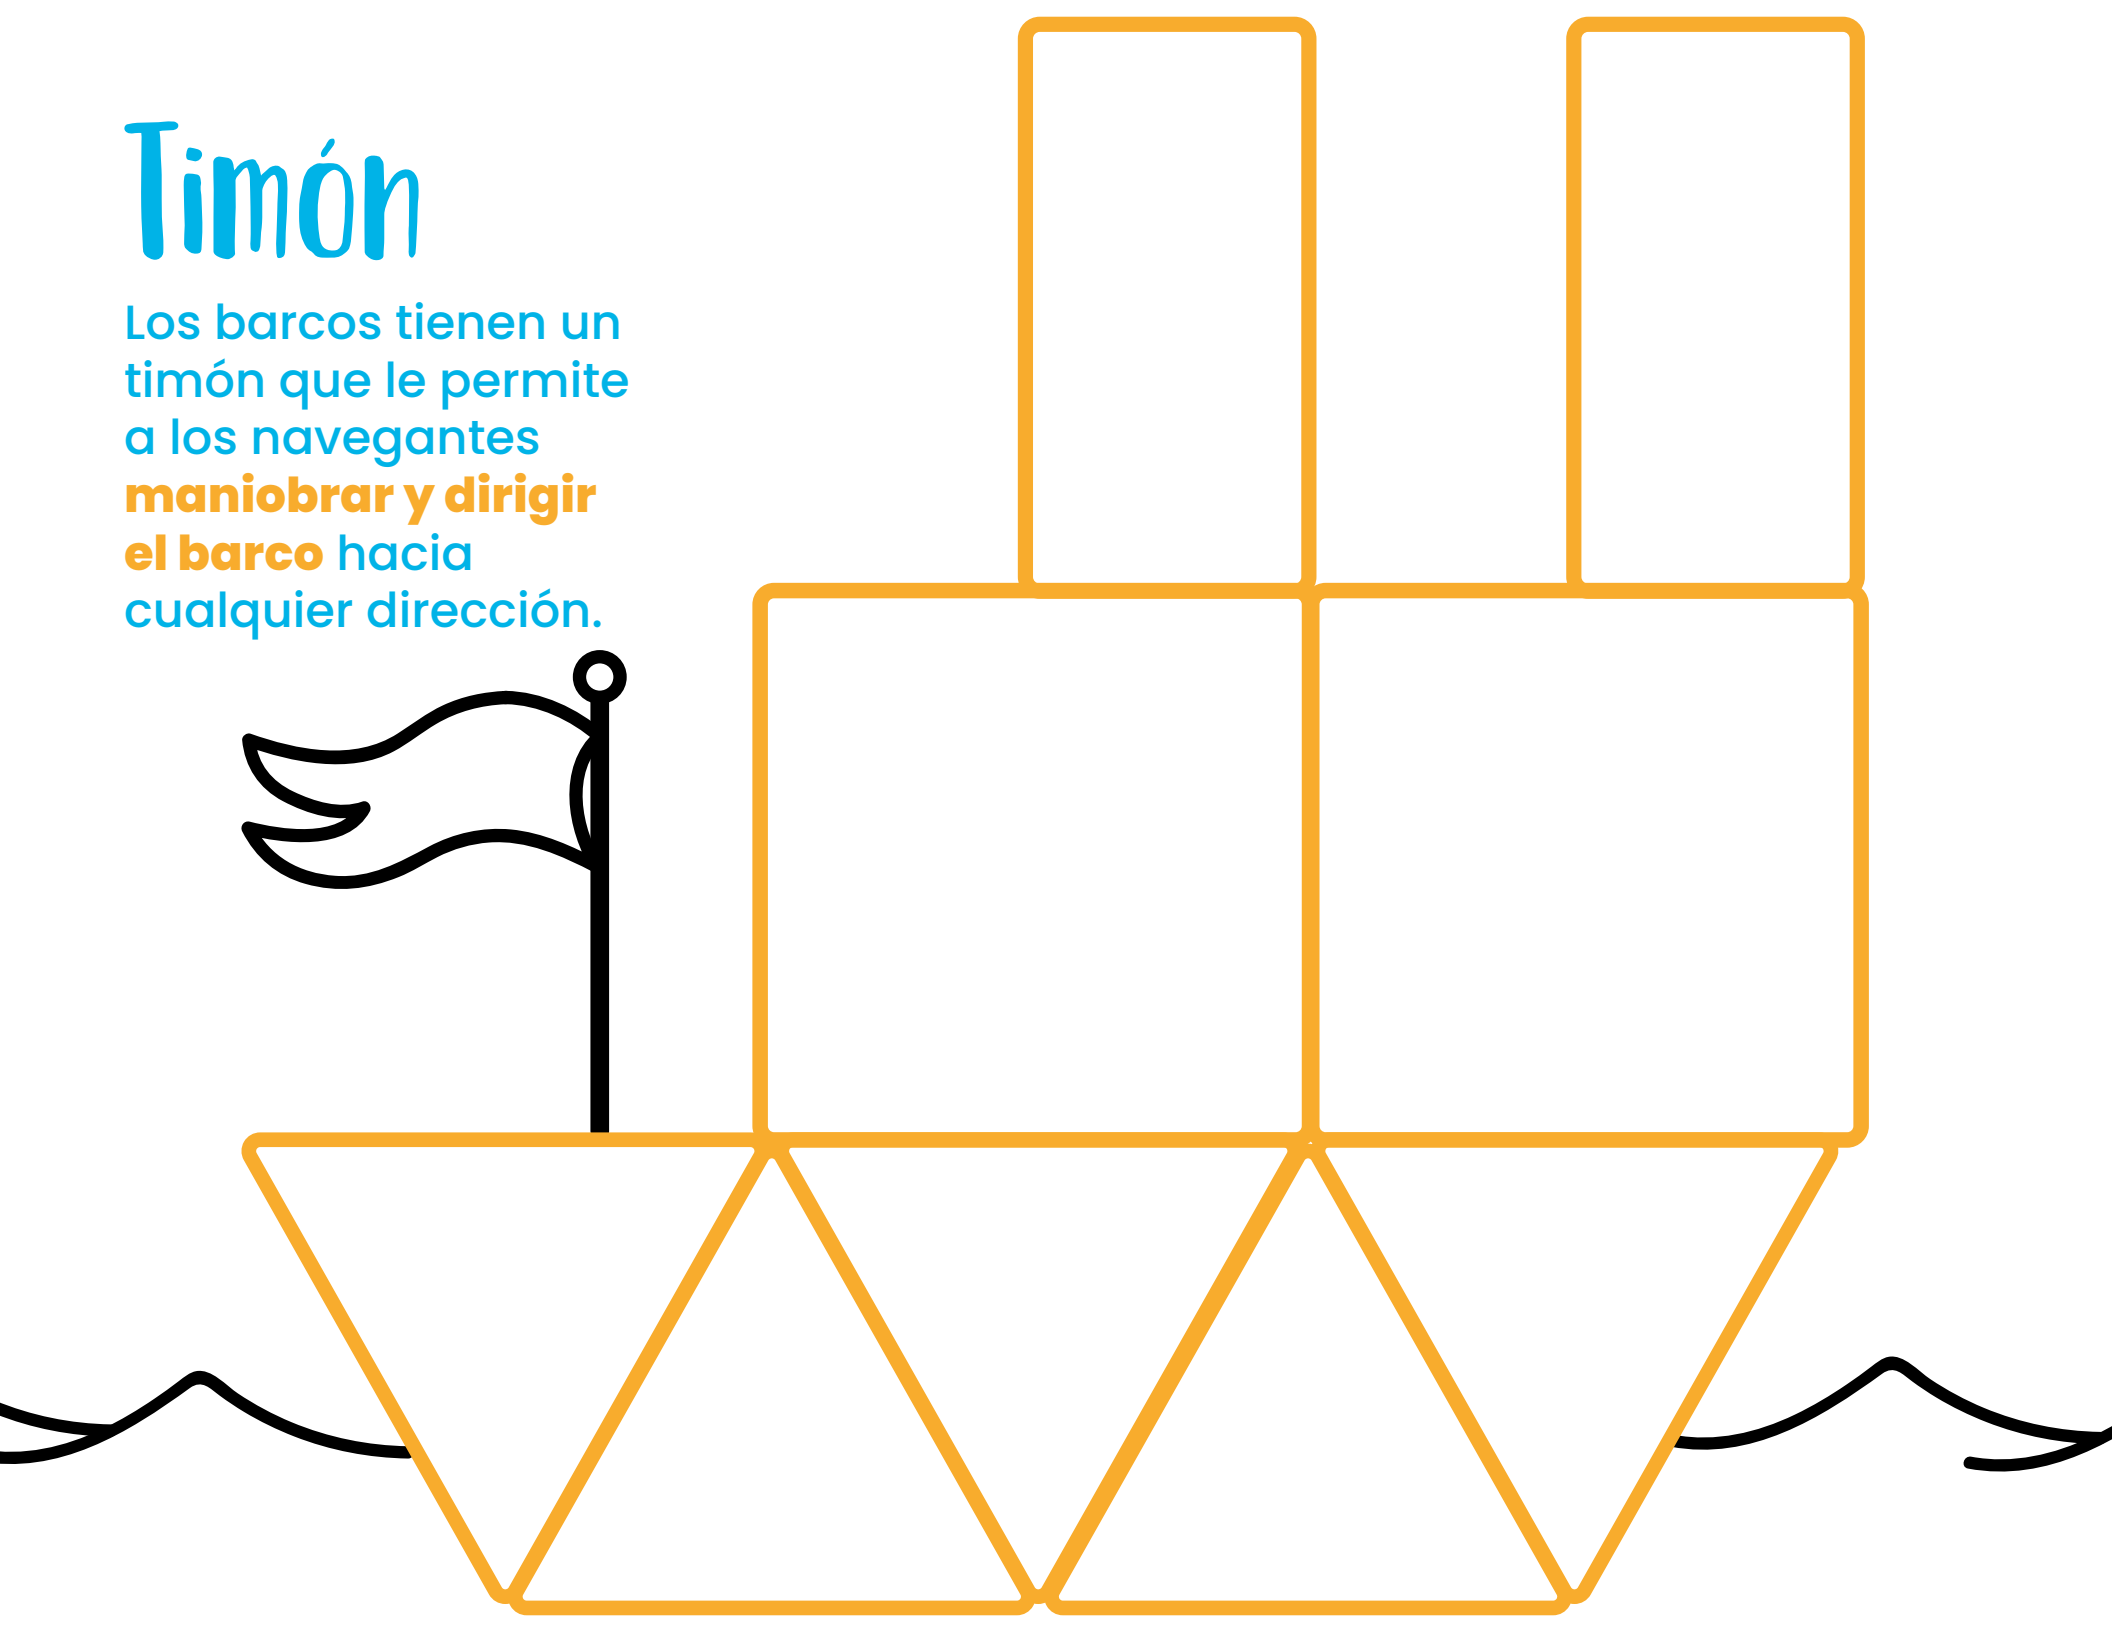

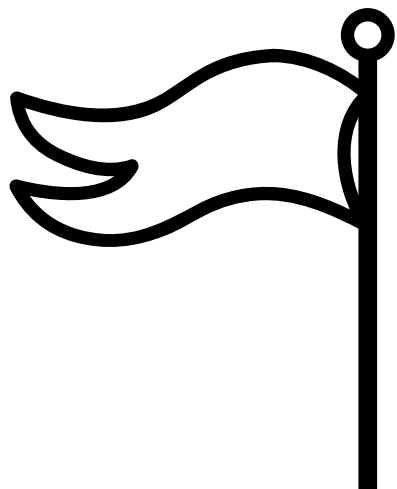

es el lugar **donde se construyen** y arreglan los barcos. Los astilleros se construyen cerca del mar o de ríos navegables, para permitir el acceso de **las embarcaciones.**

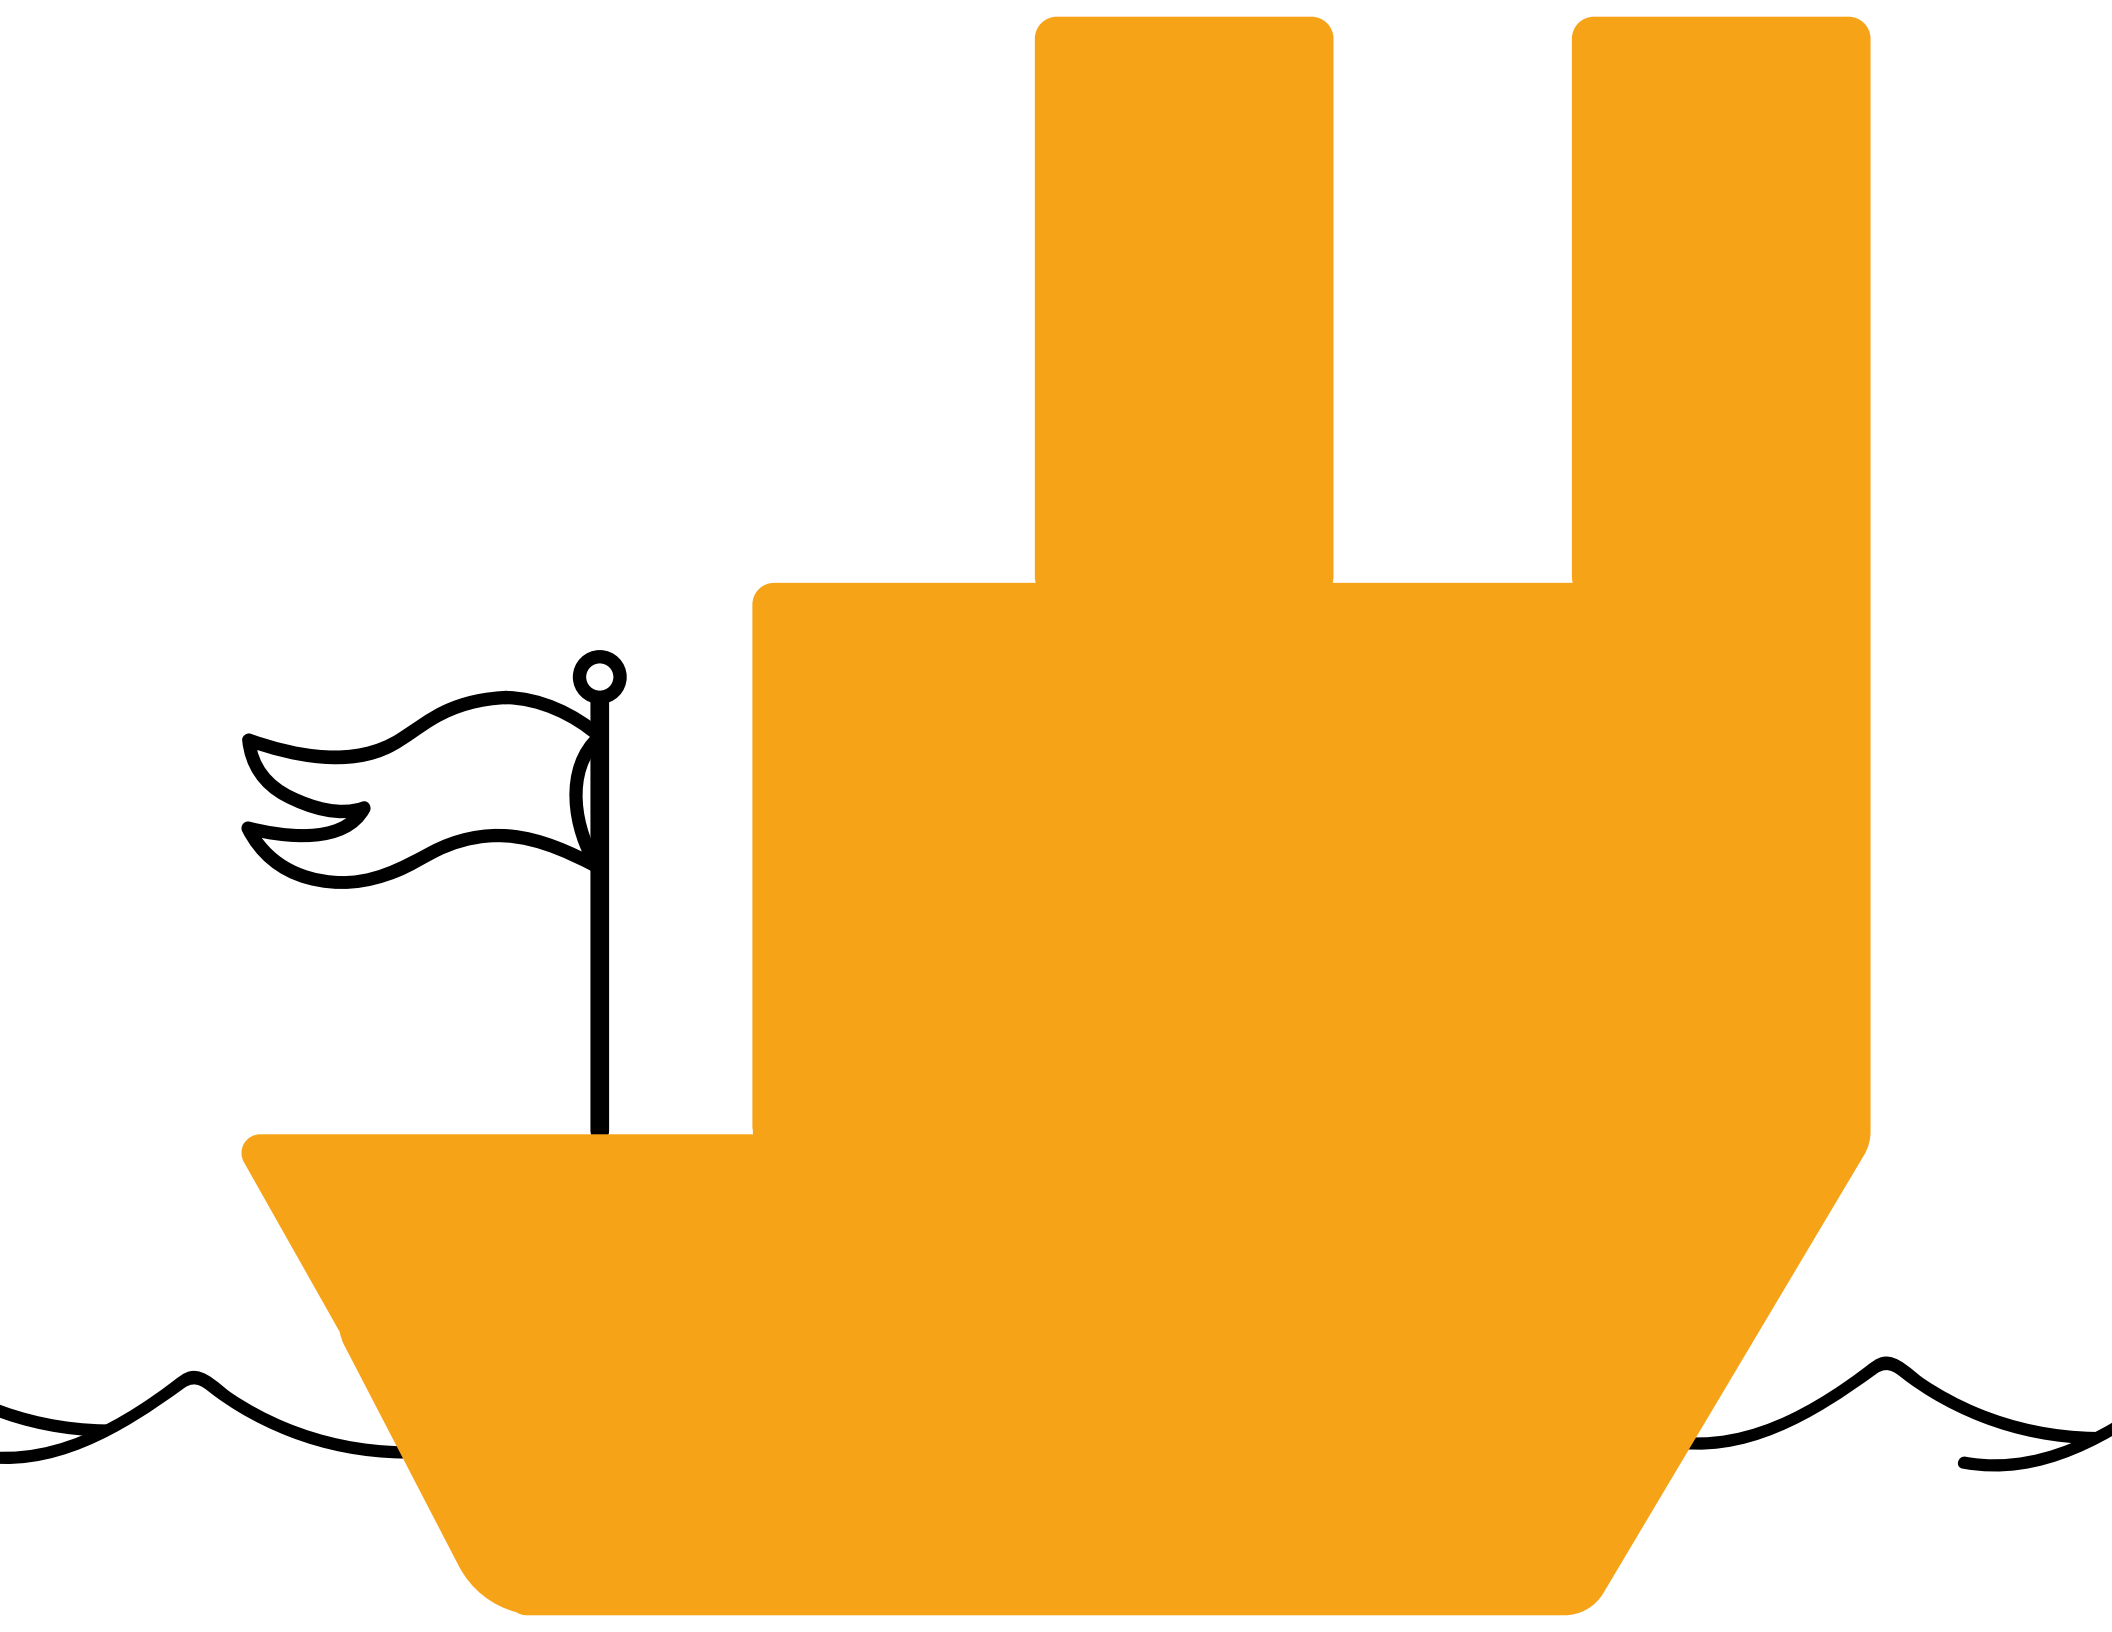

Timón

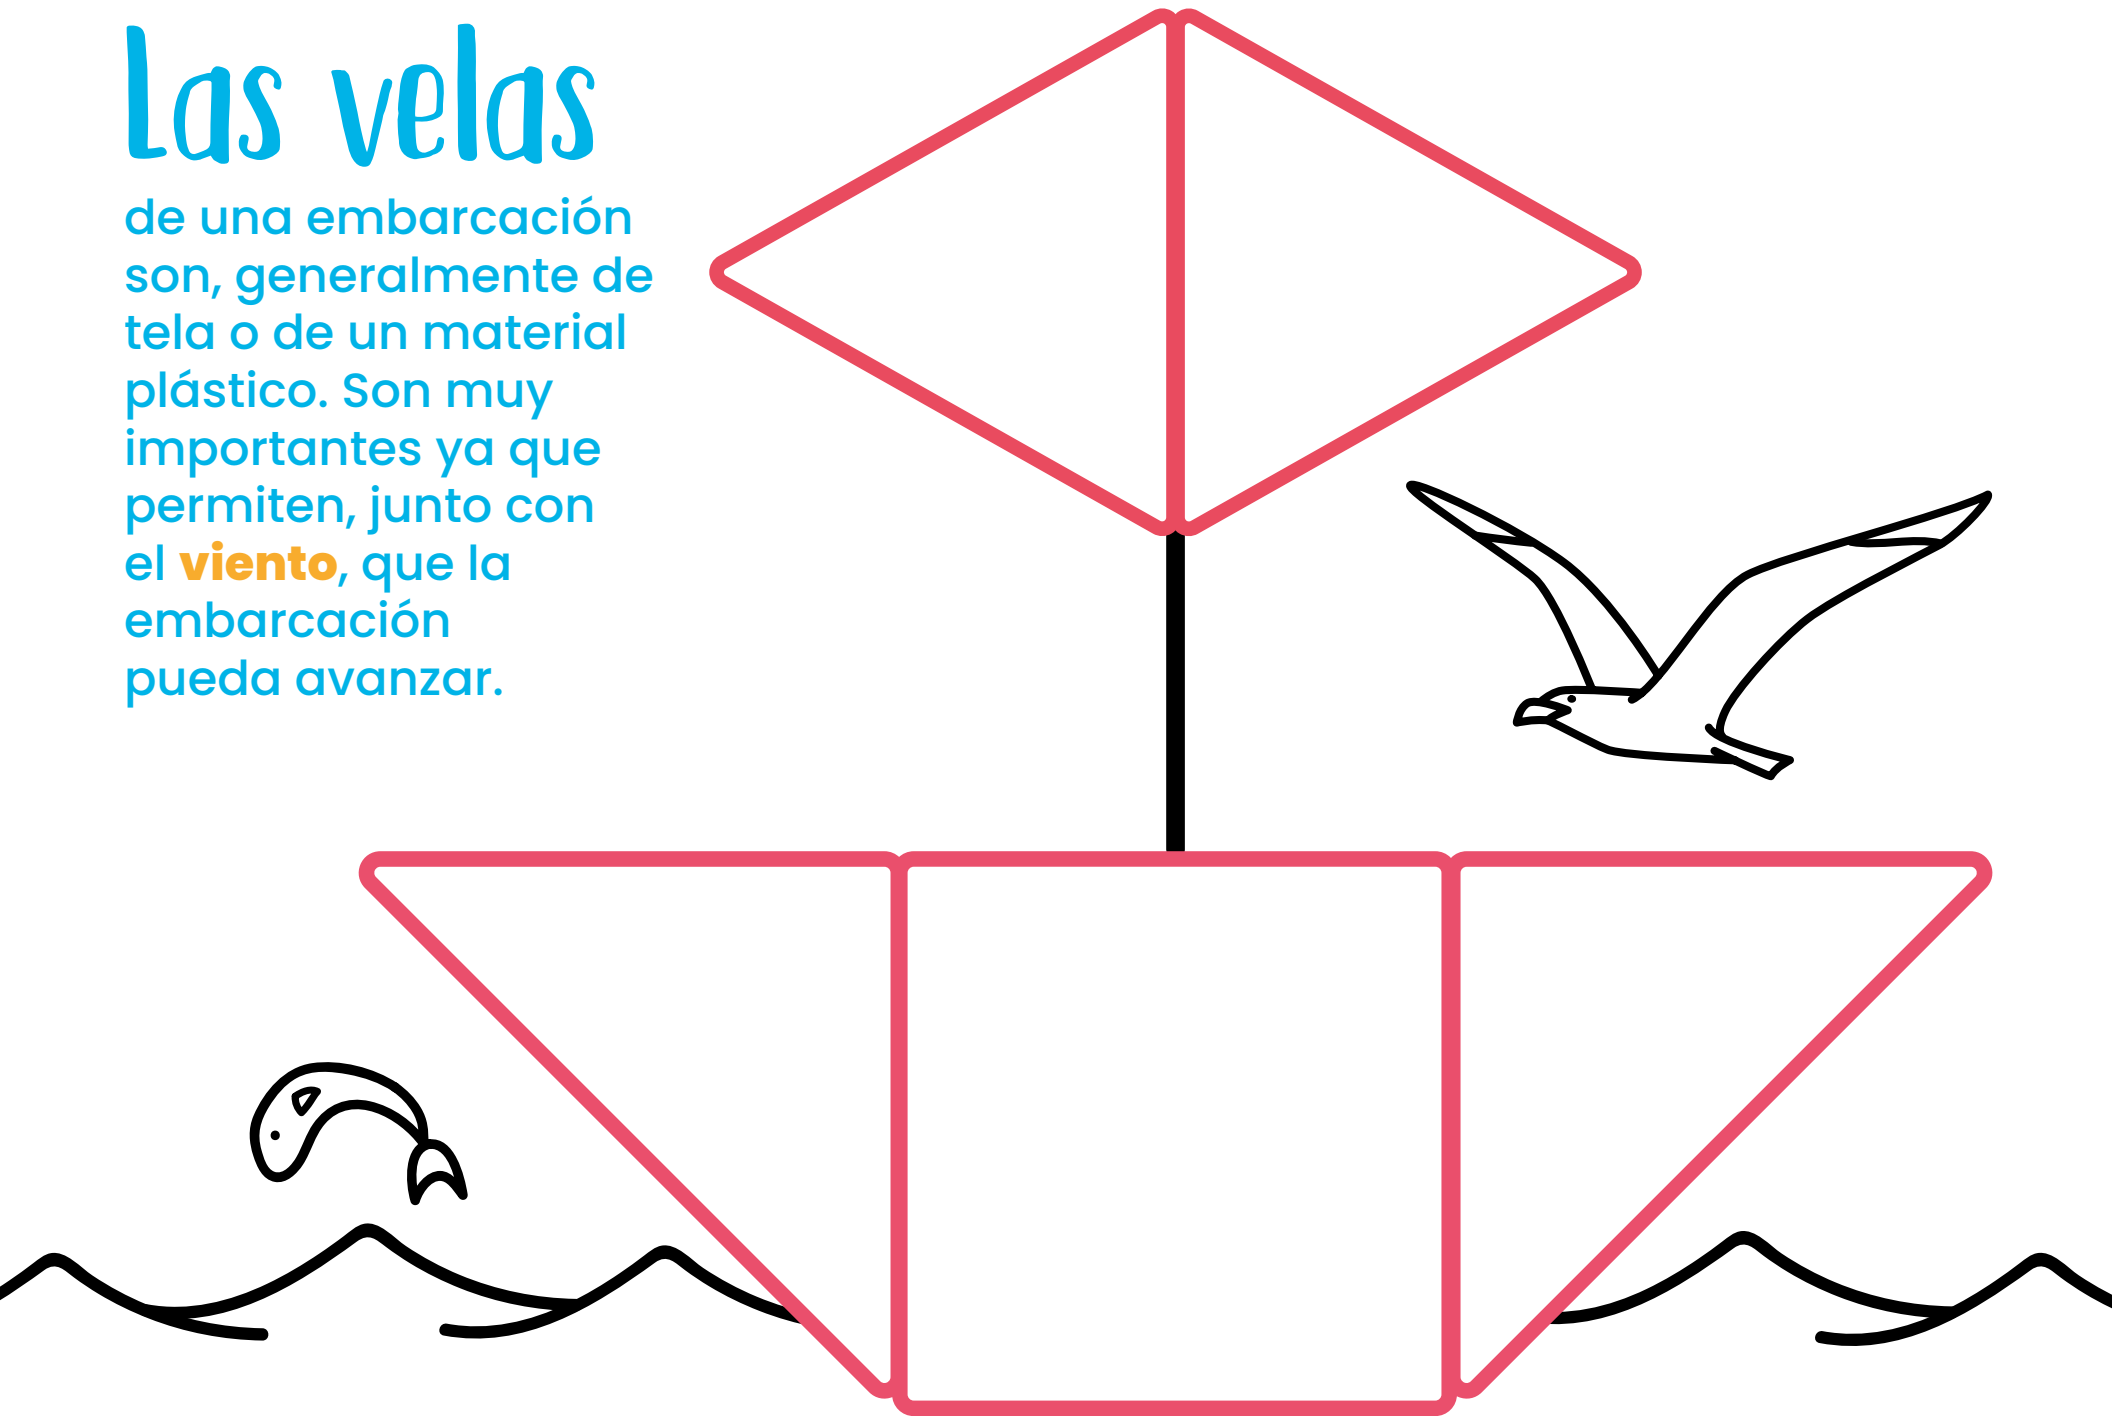

Los barcos tienen un timón que le permite a los navegantes **maniobrar y dirigir el barco** hacia cualquier dirección.

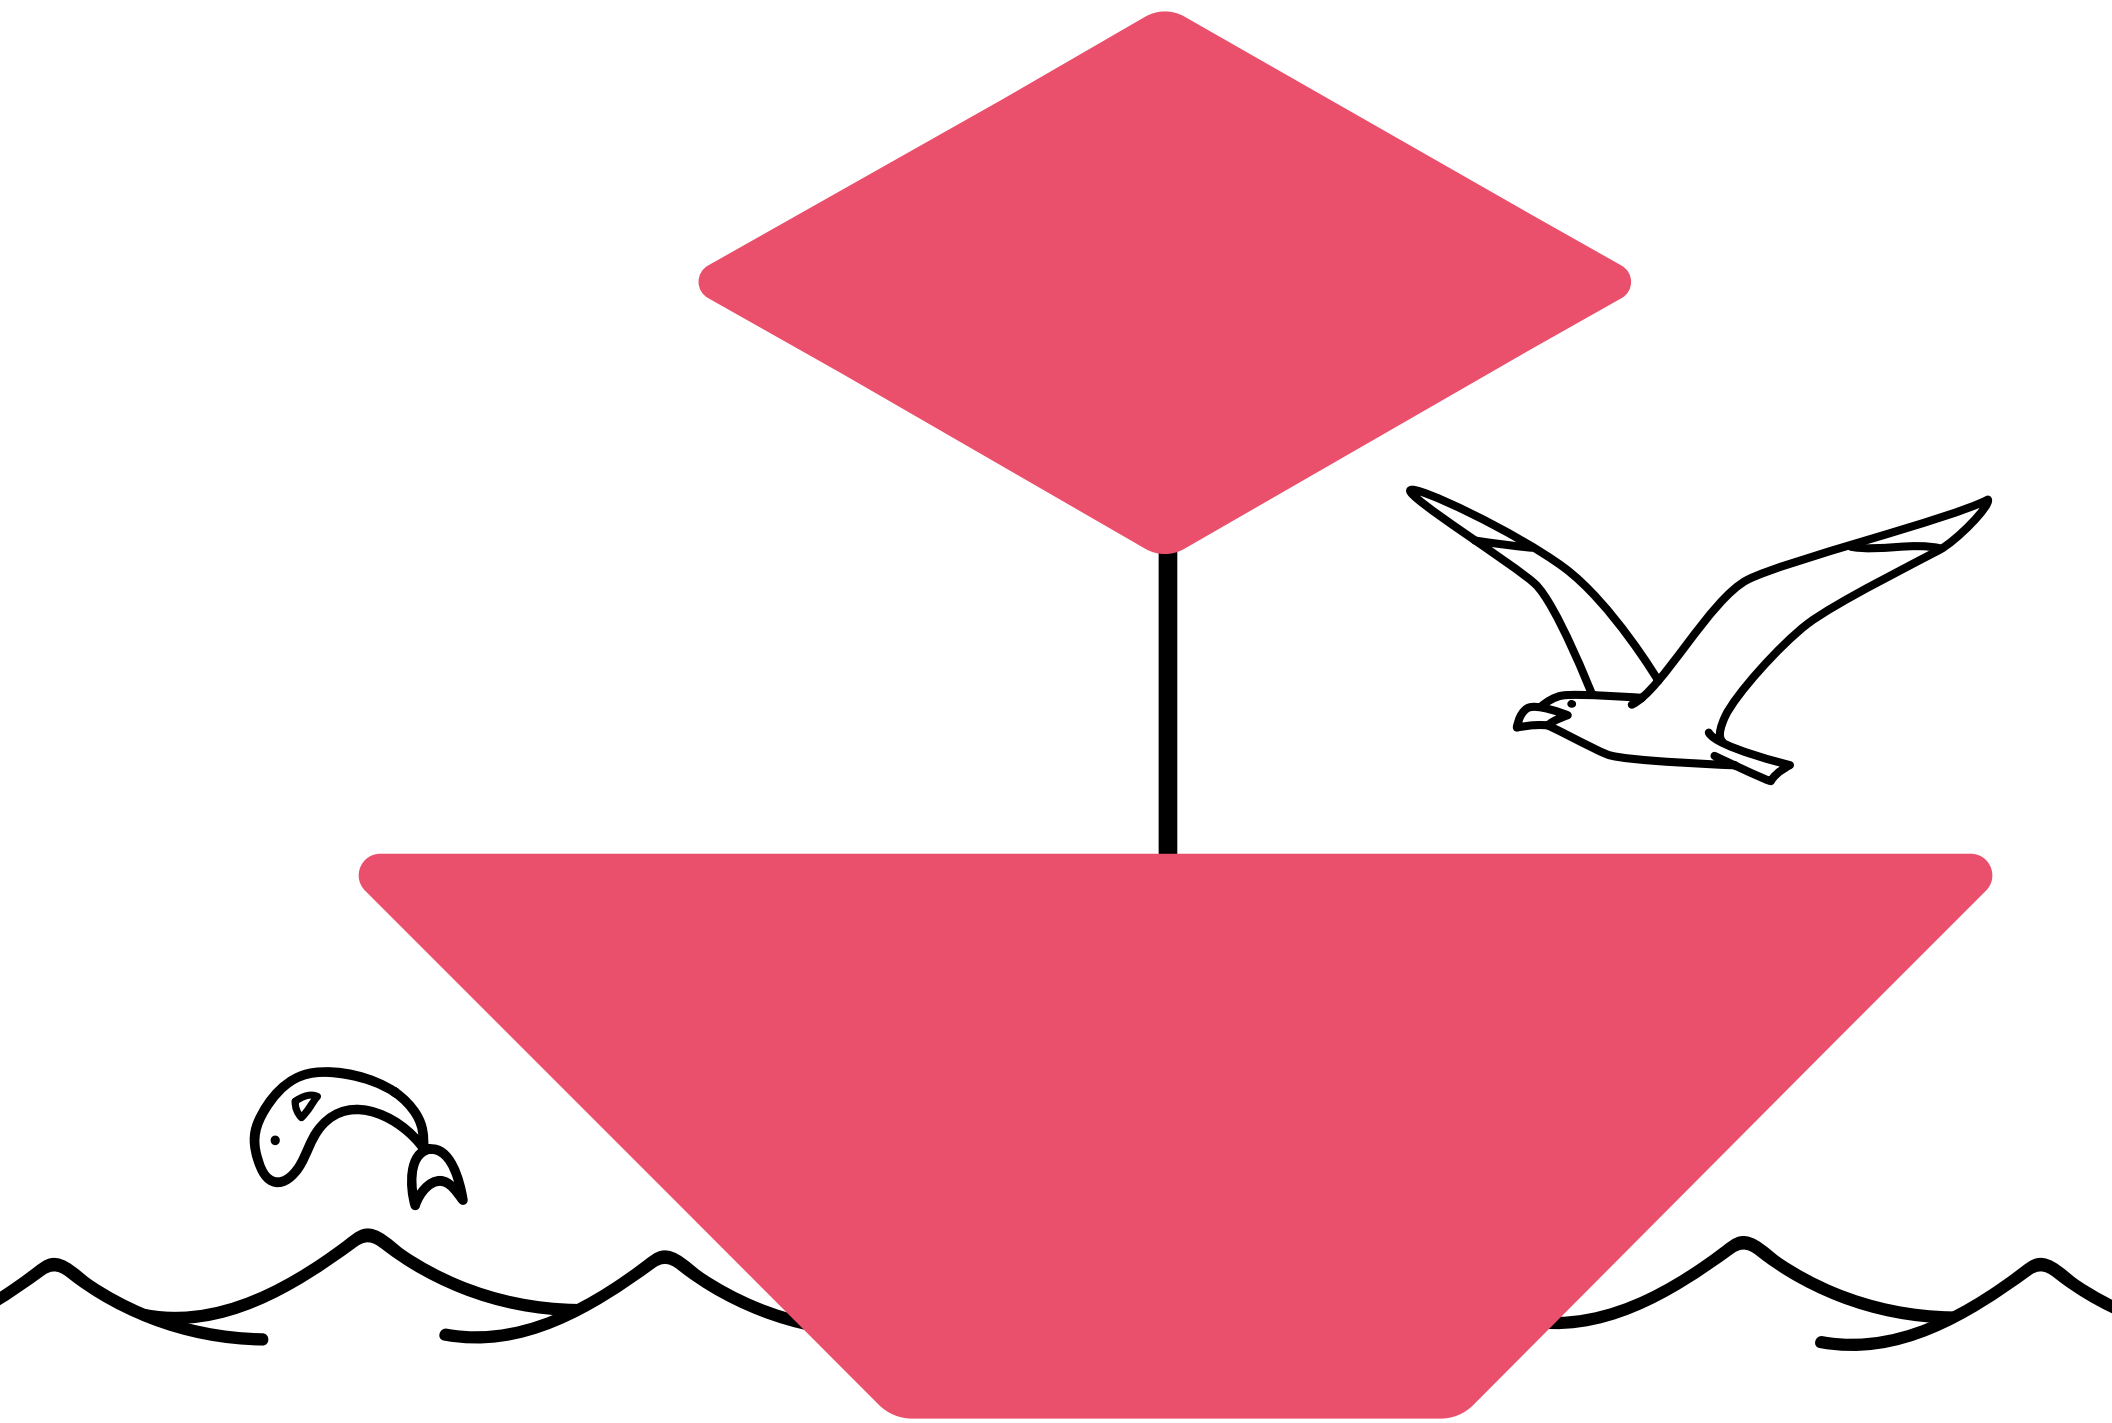

Las velas

de una embarcación son, generalmente de tela o de un material plástico. Son muy importantes ya que permiten, junto con el **viento**, que la embarcación pueda avanzar.

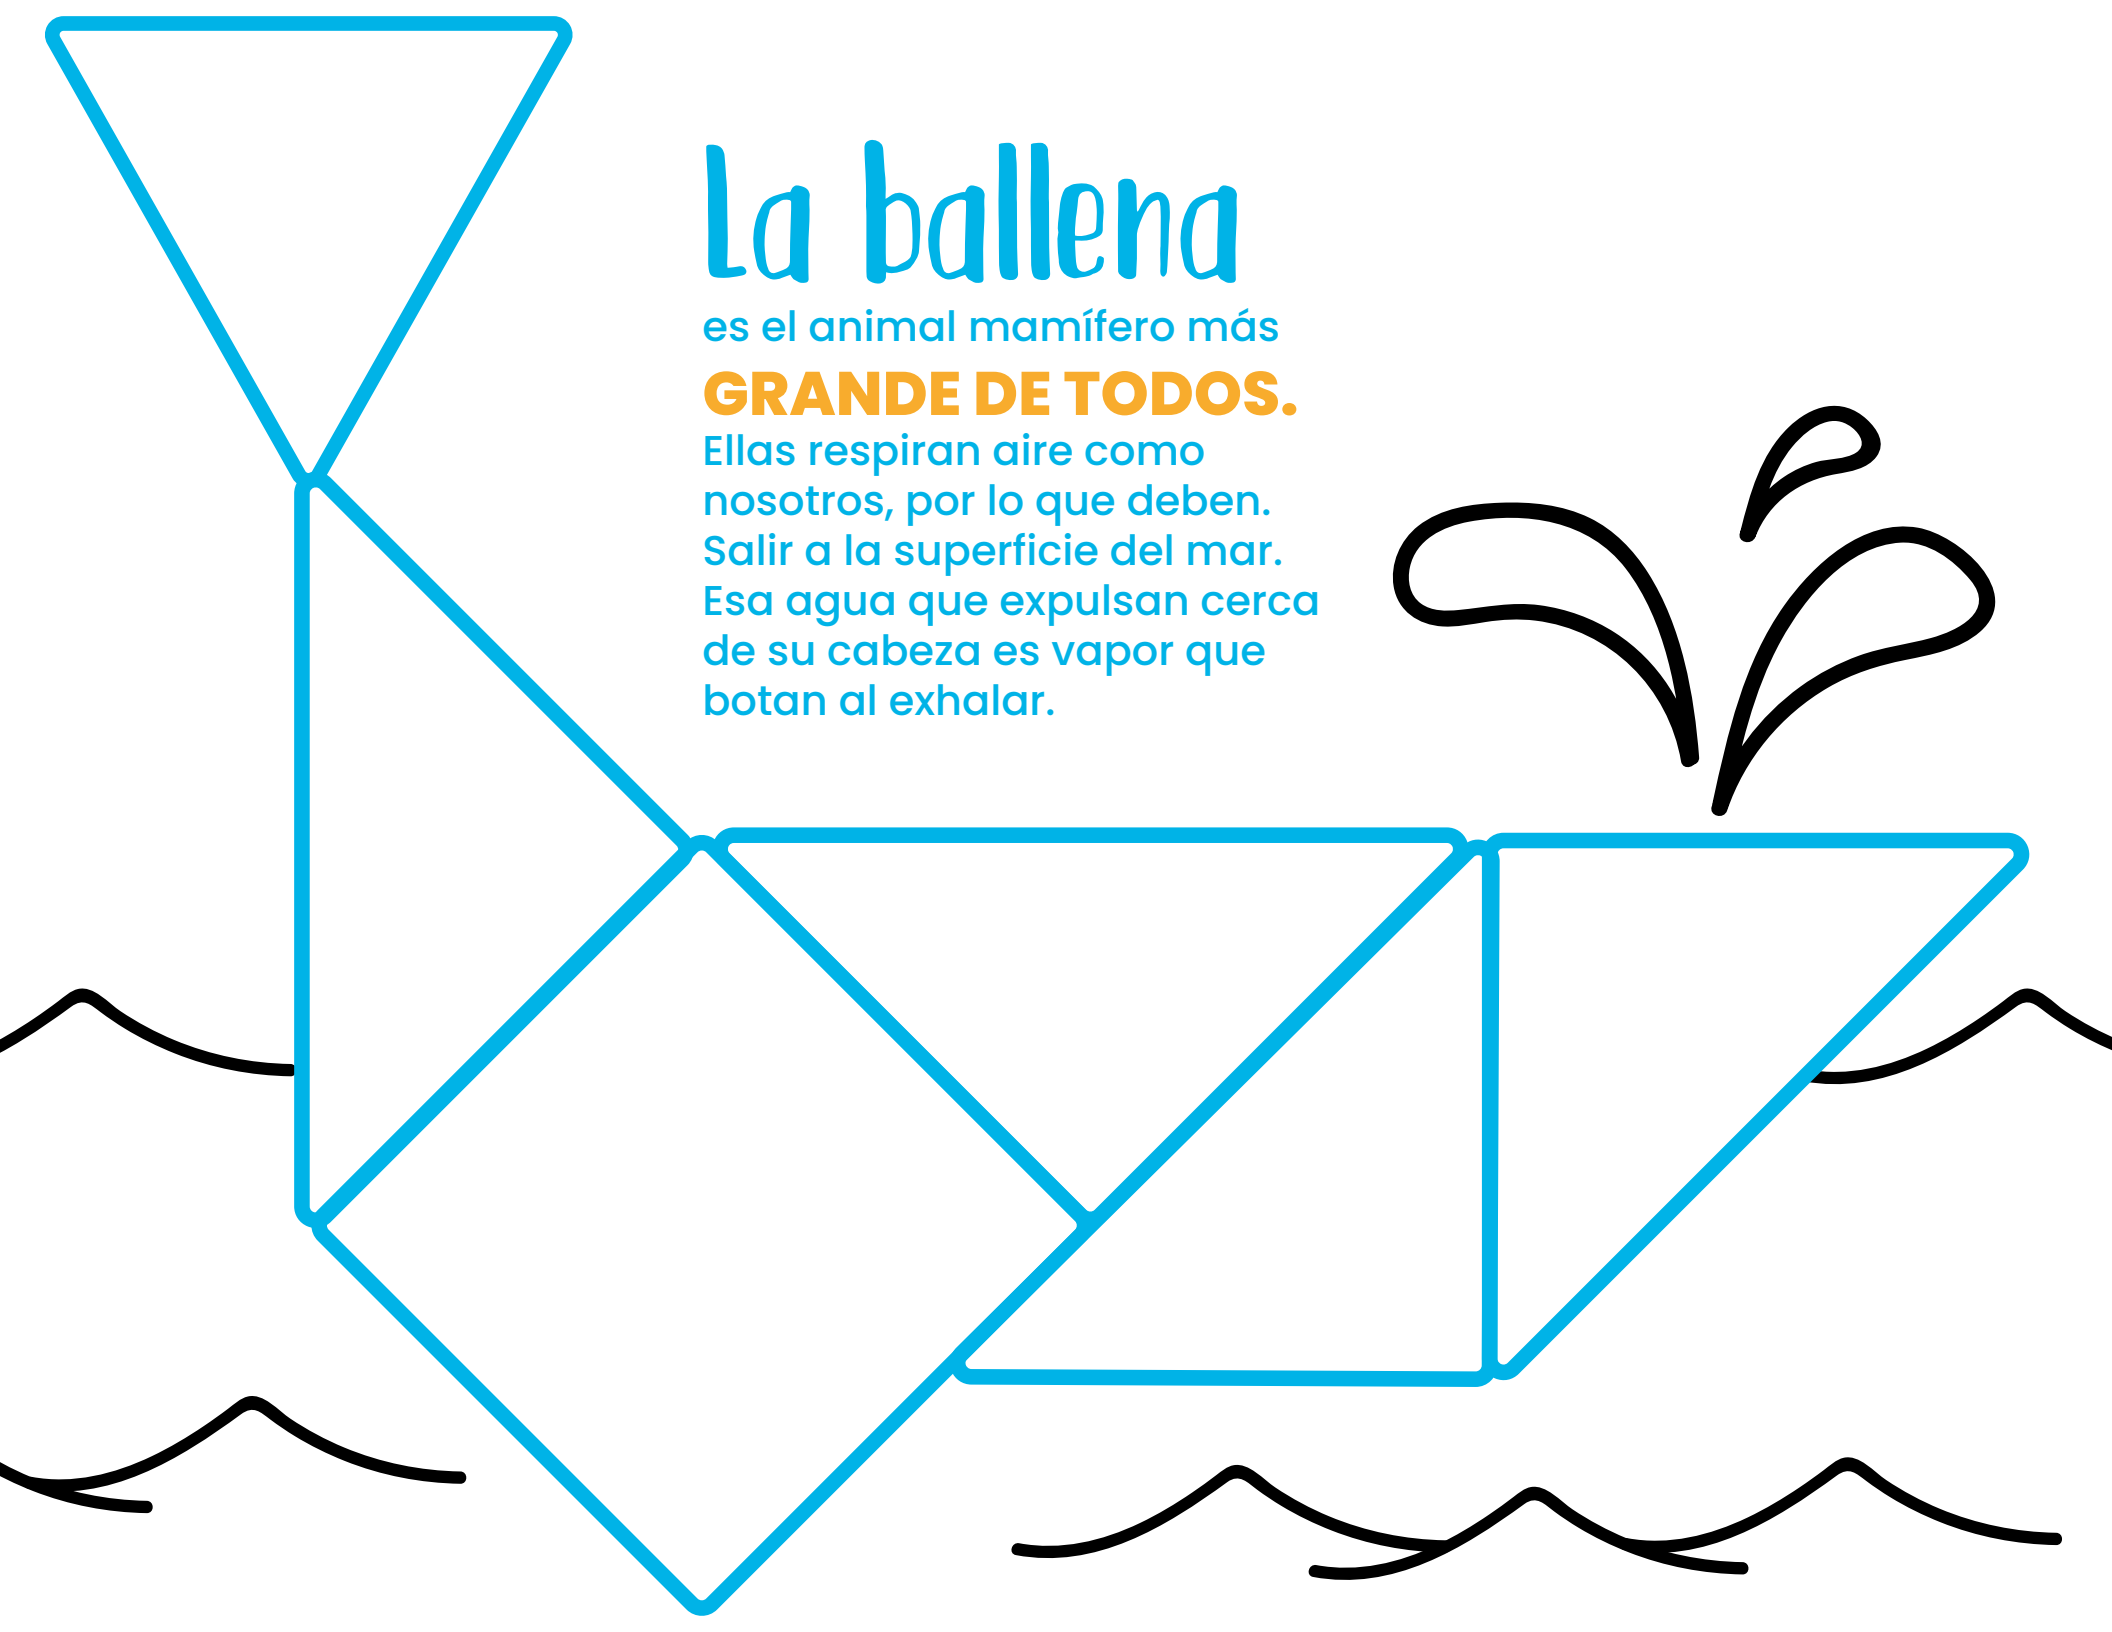

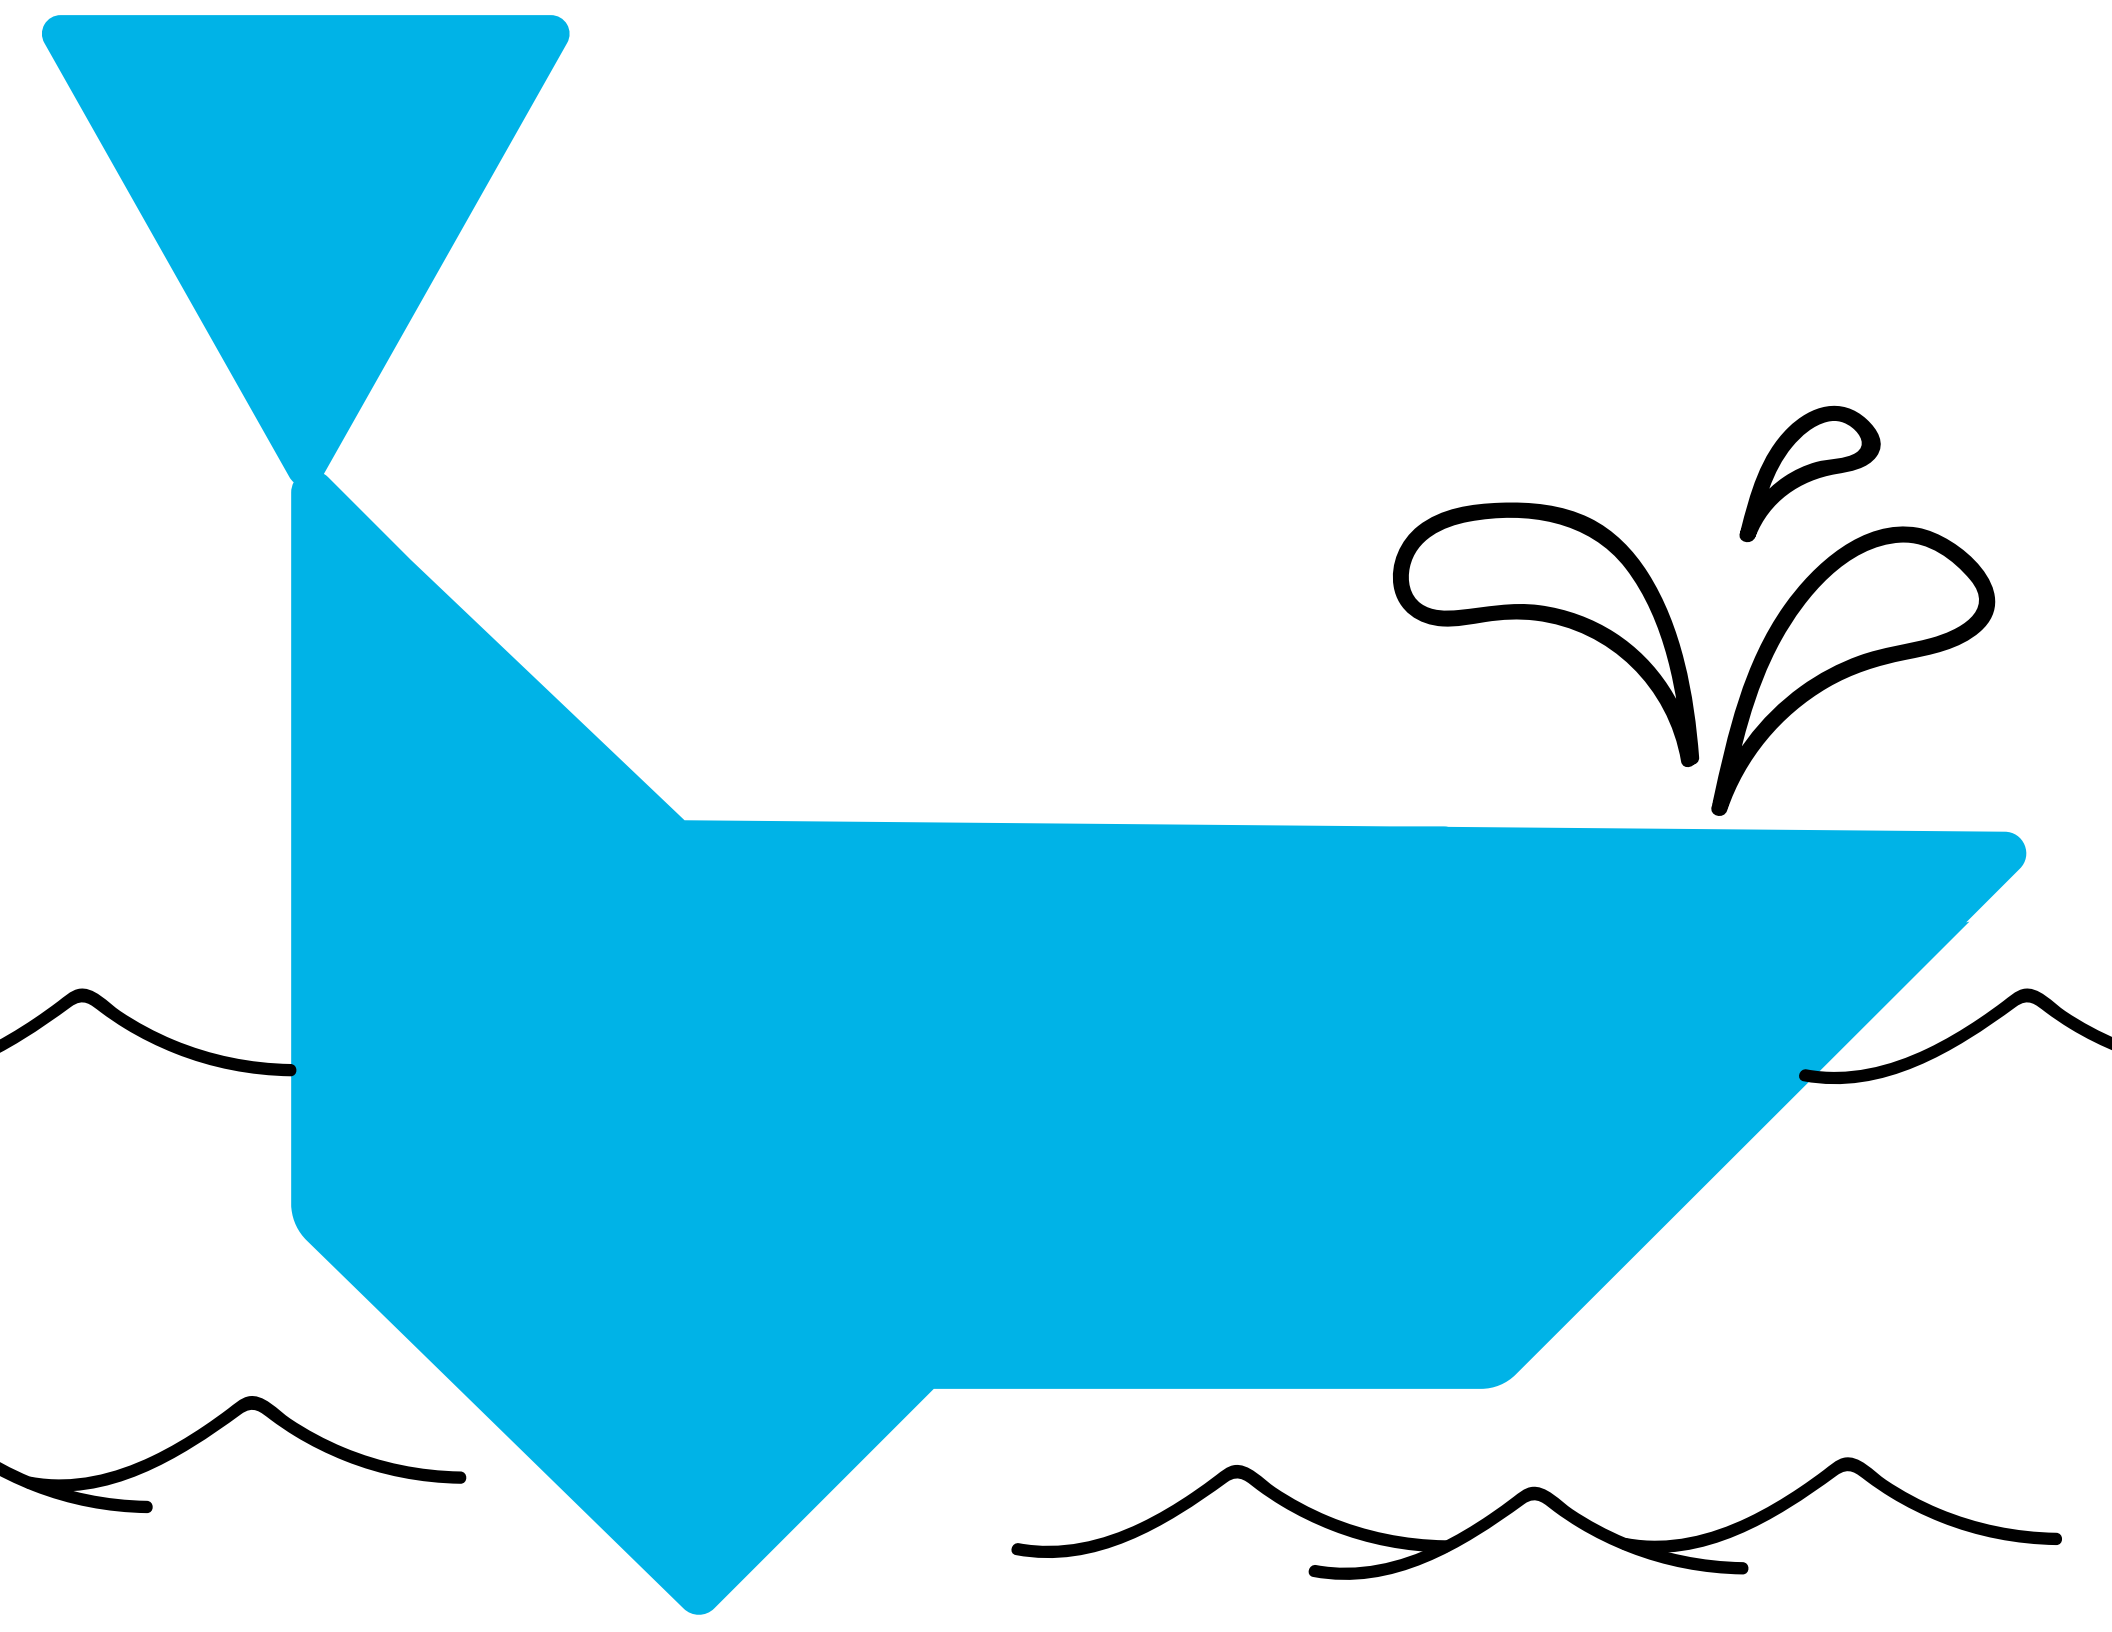

La ballena

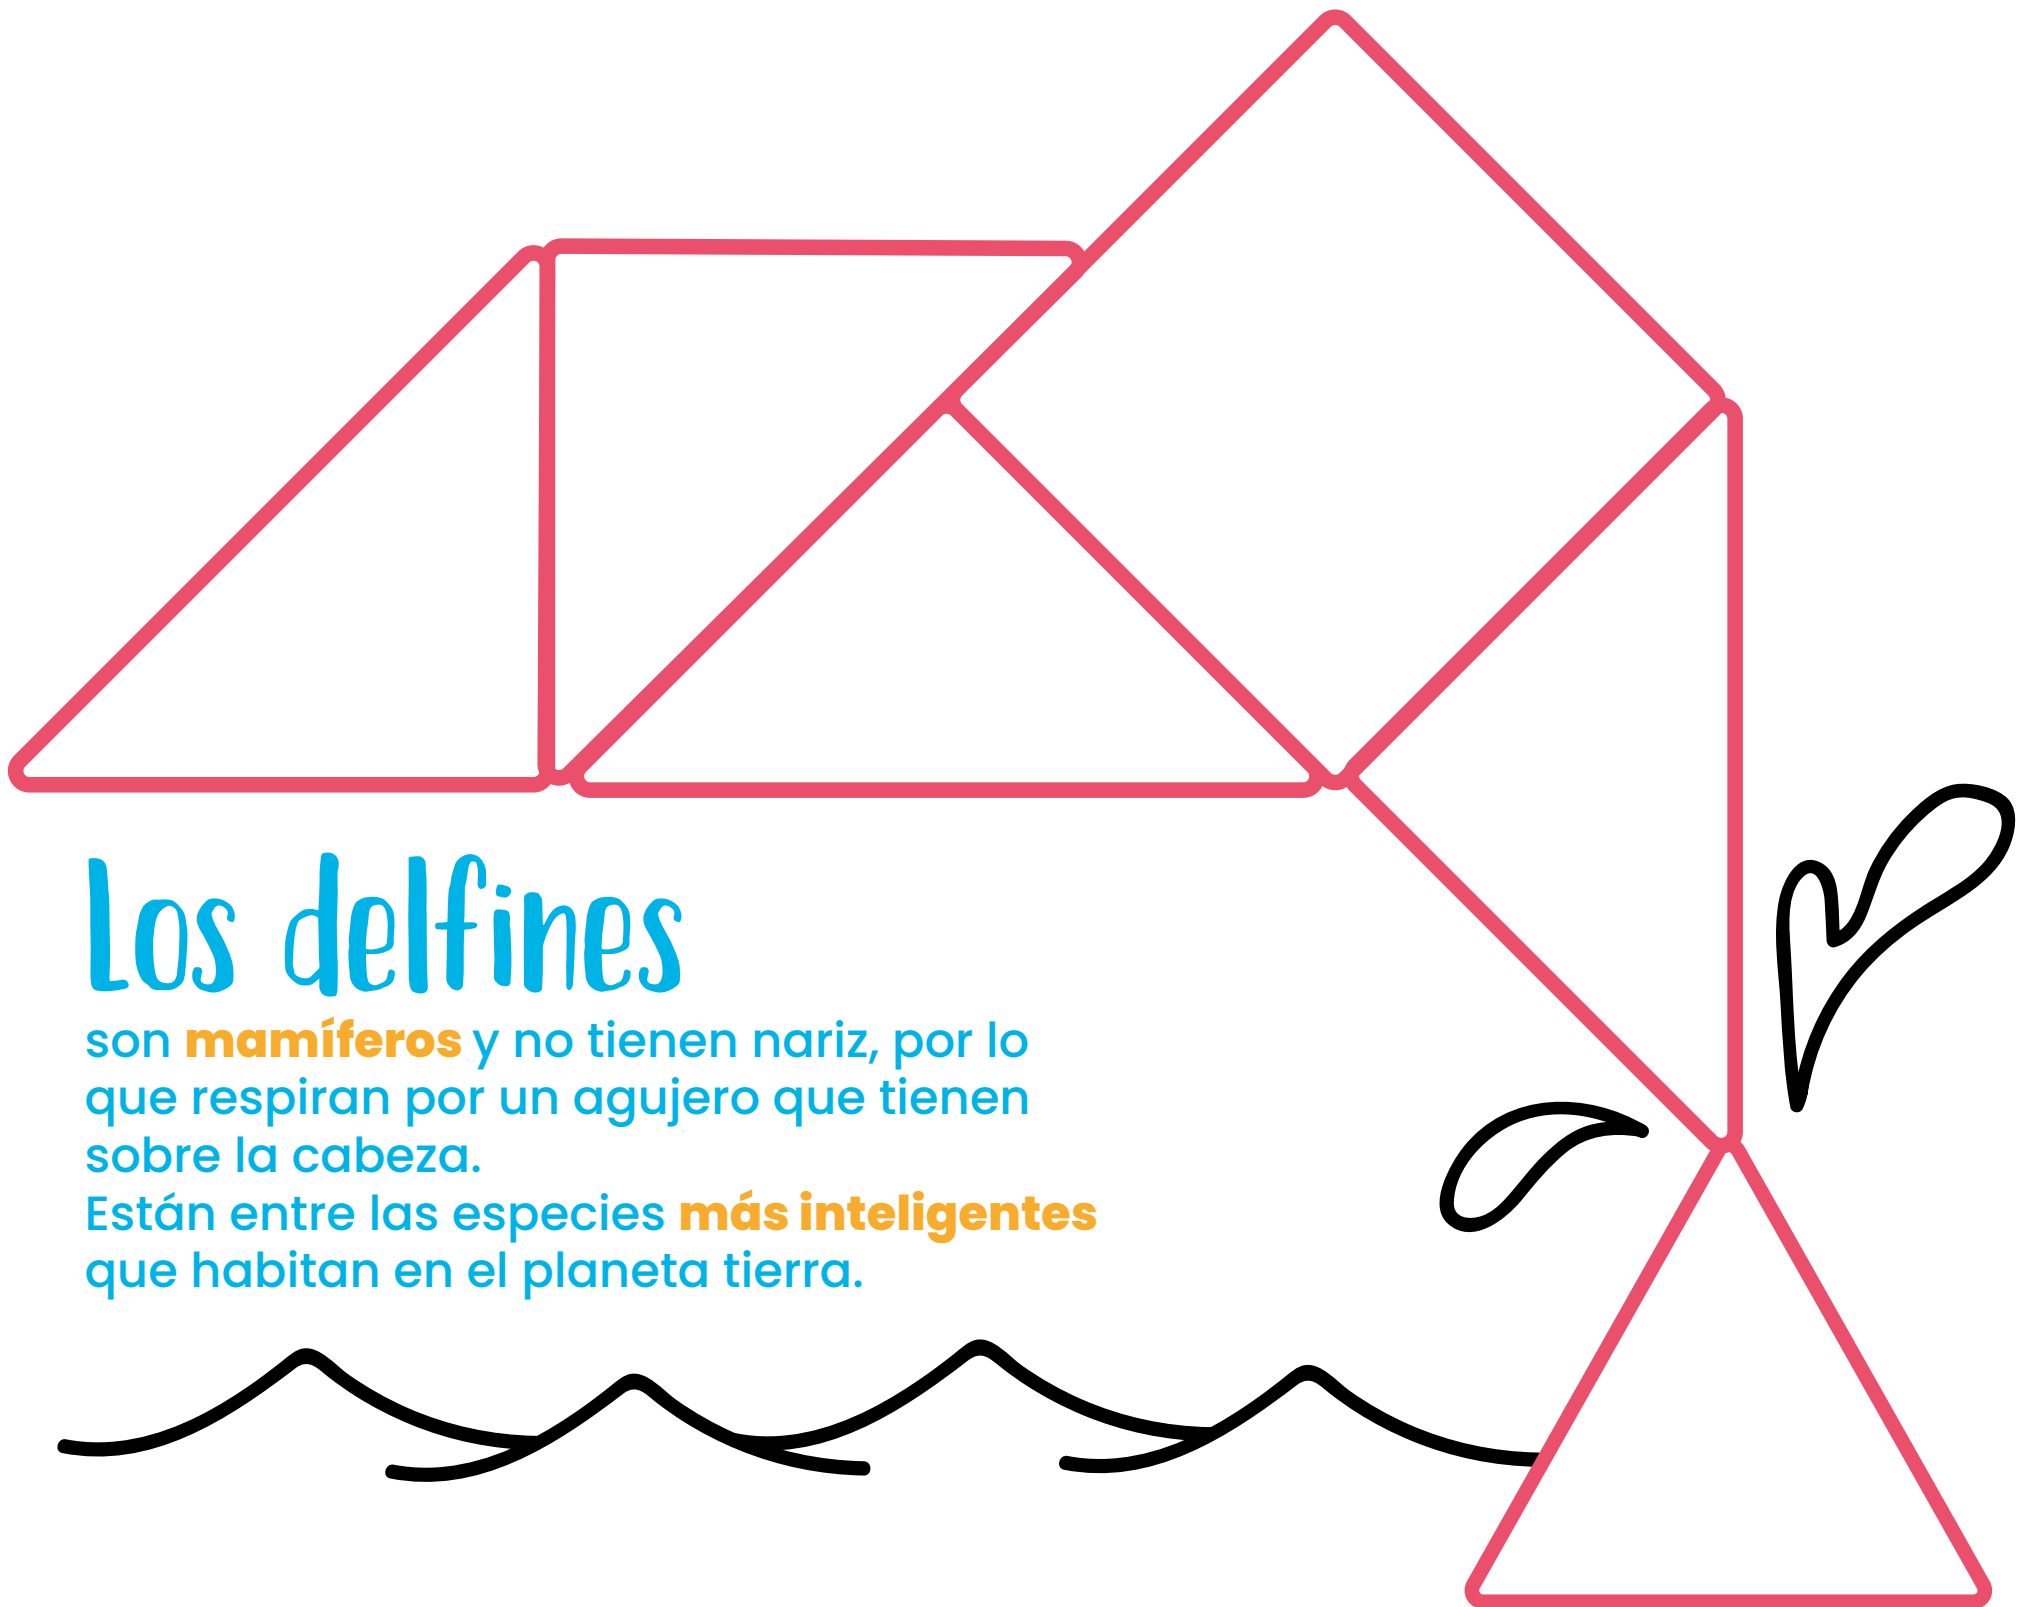

es el animal mamífero más

GRANDE DE TODOS.

Elas respiran aire como nosotros, por lo que deben. Salir a la superficie del mar. Esa agua que expulsan cerca de su cabeza es vapor que botan al exhalar.

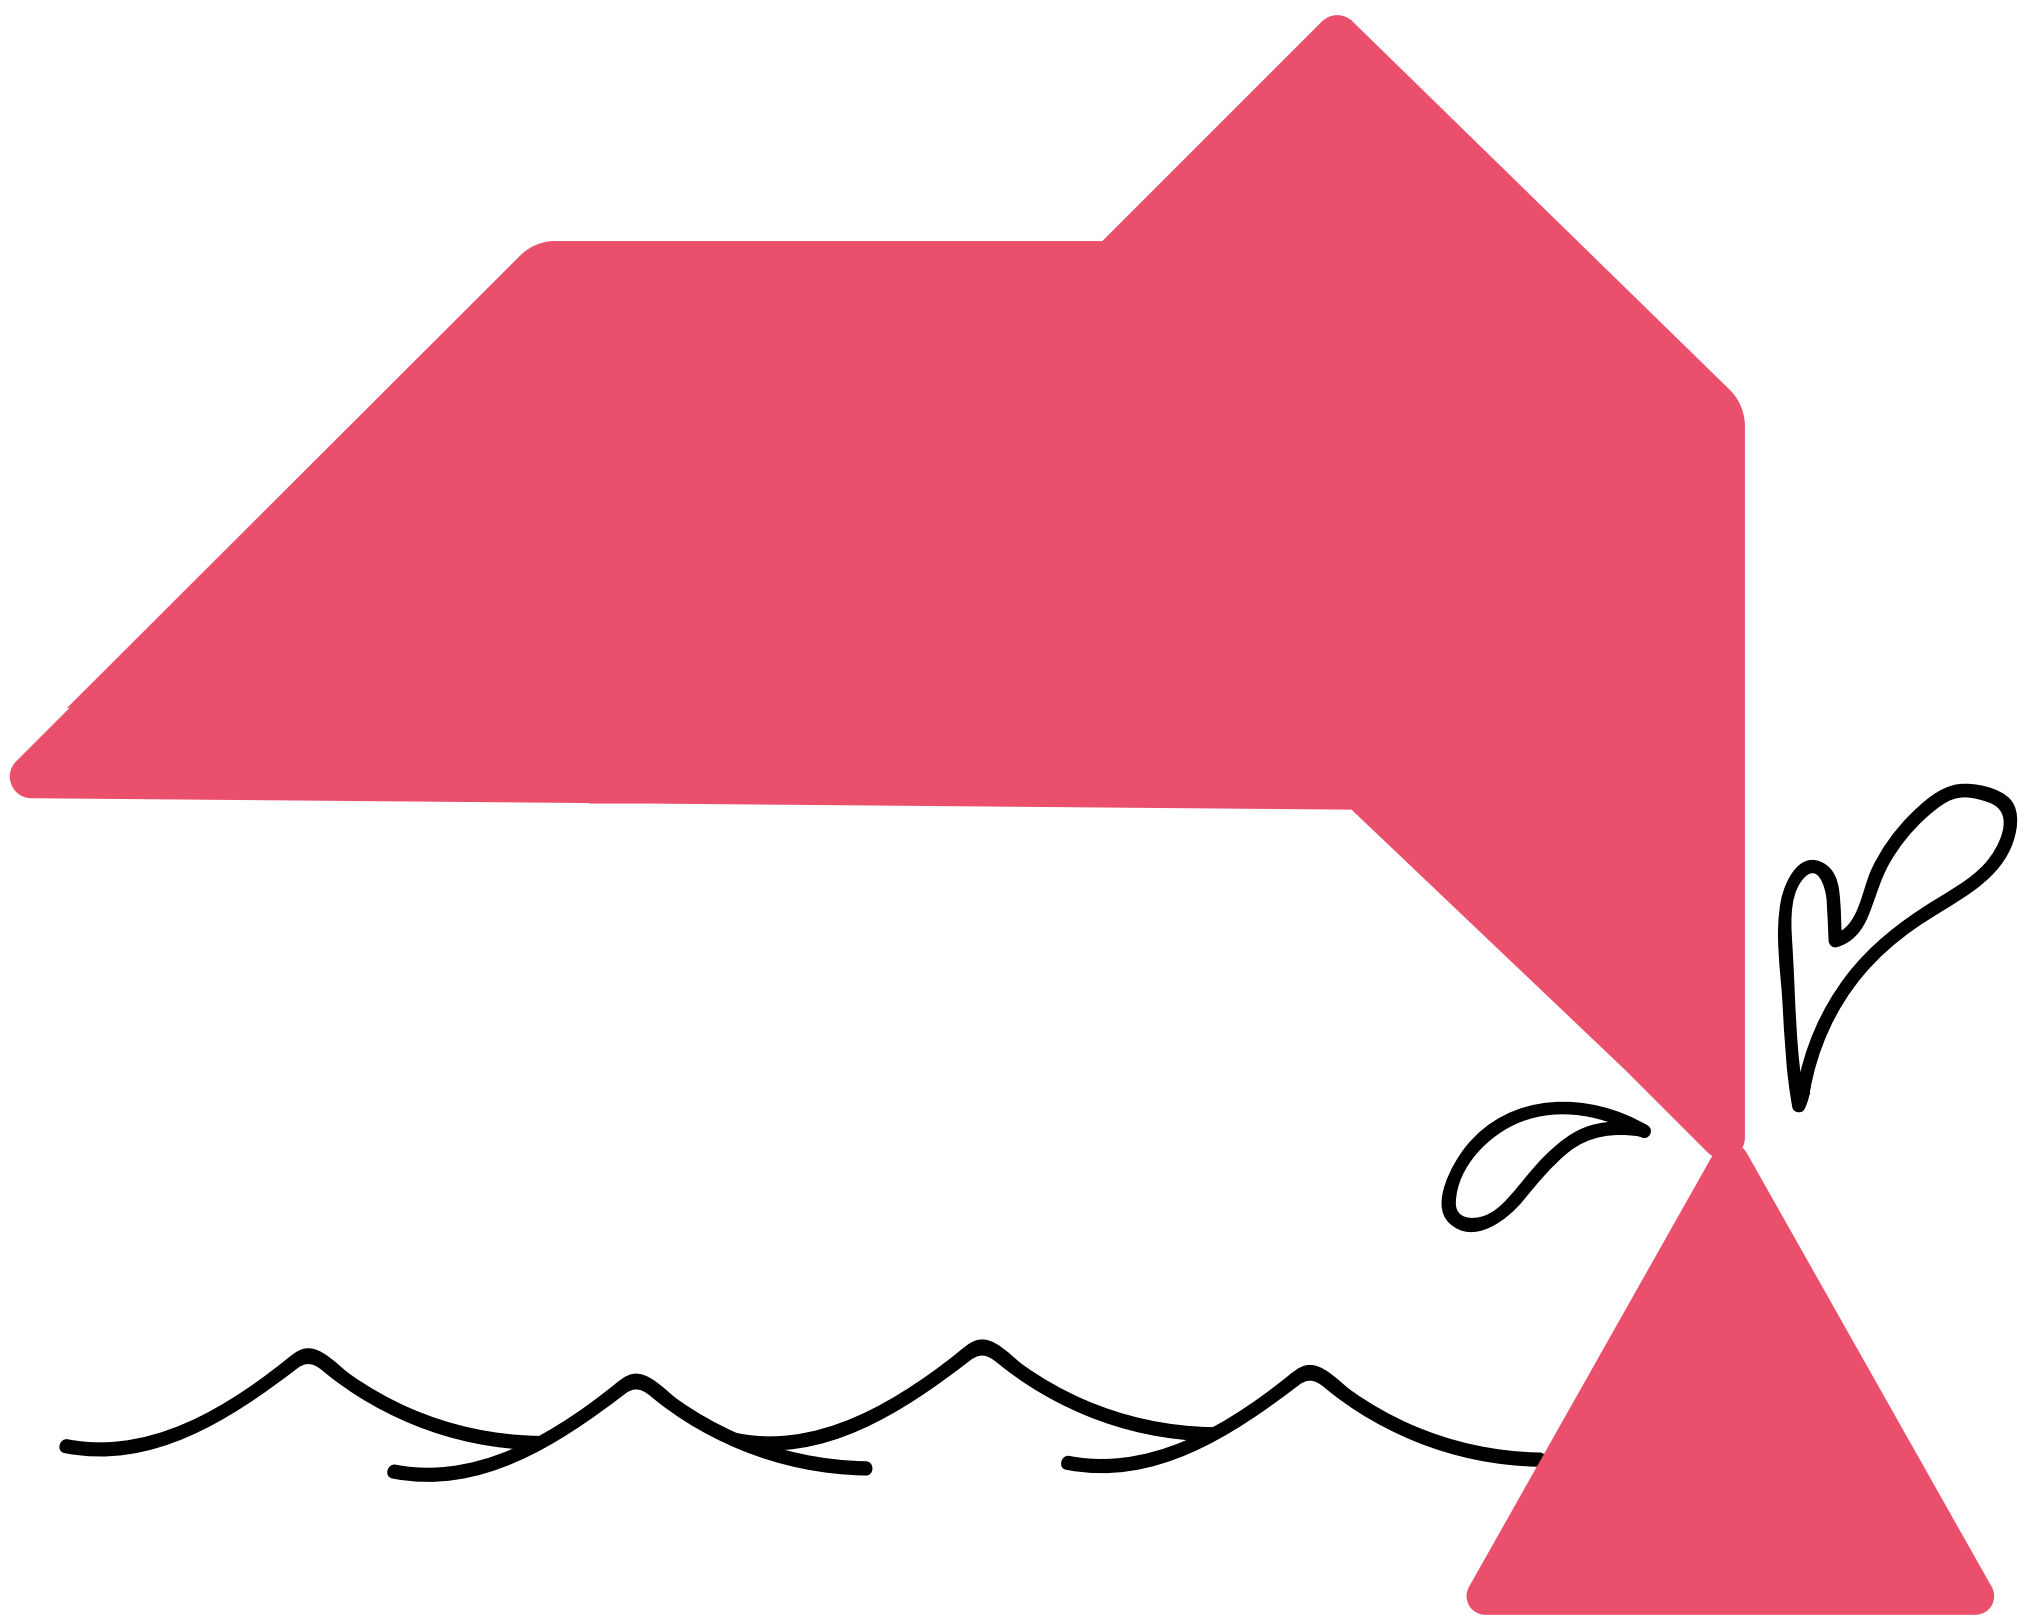

Los delfines

son **mamíferos** y no tienen nariz, por lo que respiran por un agujero que tienen sobre la cabeza.

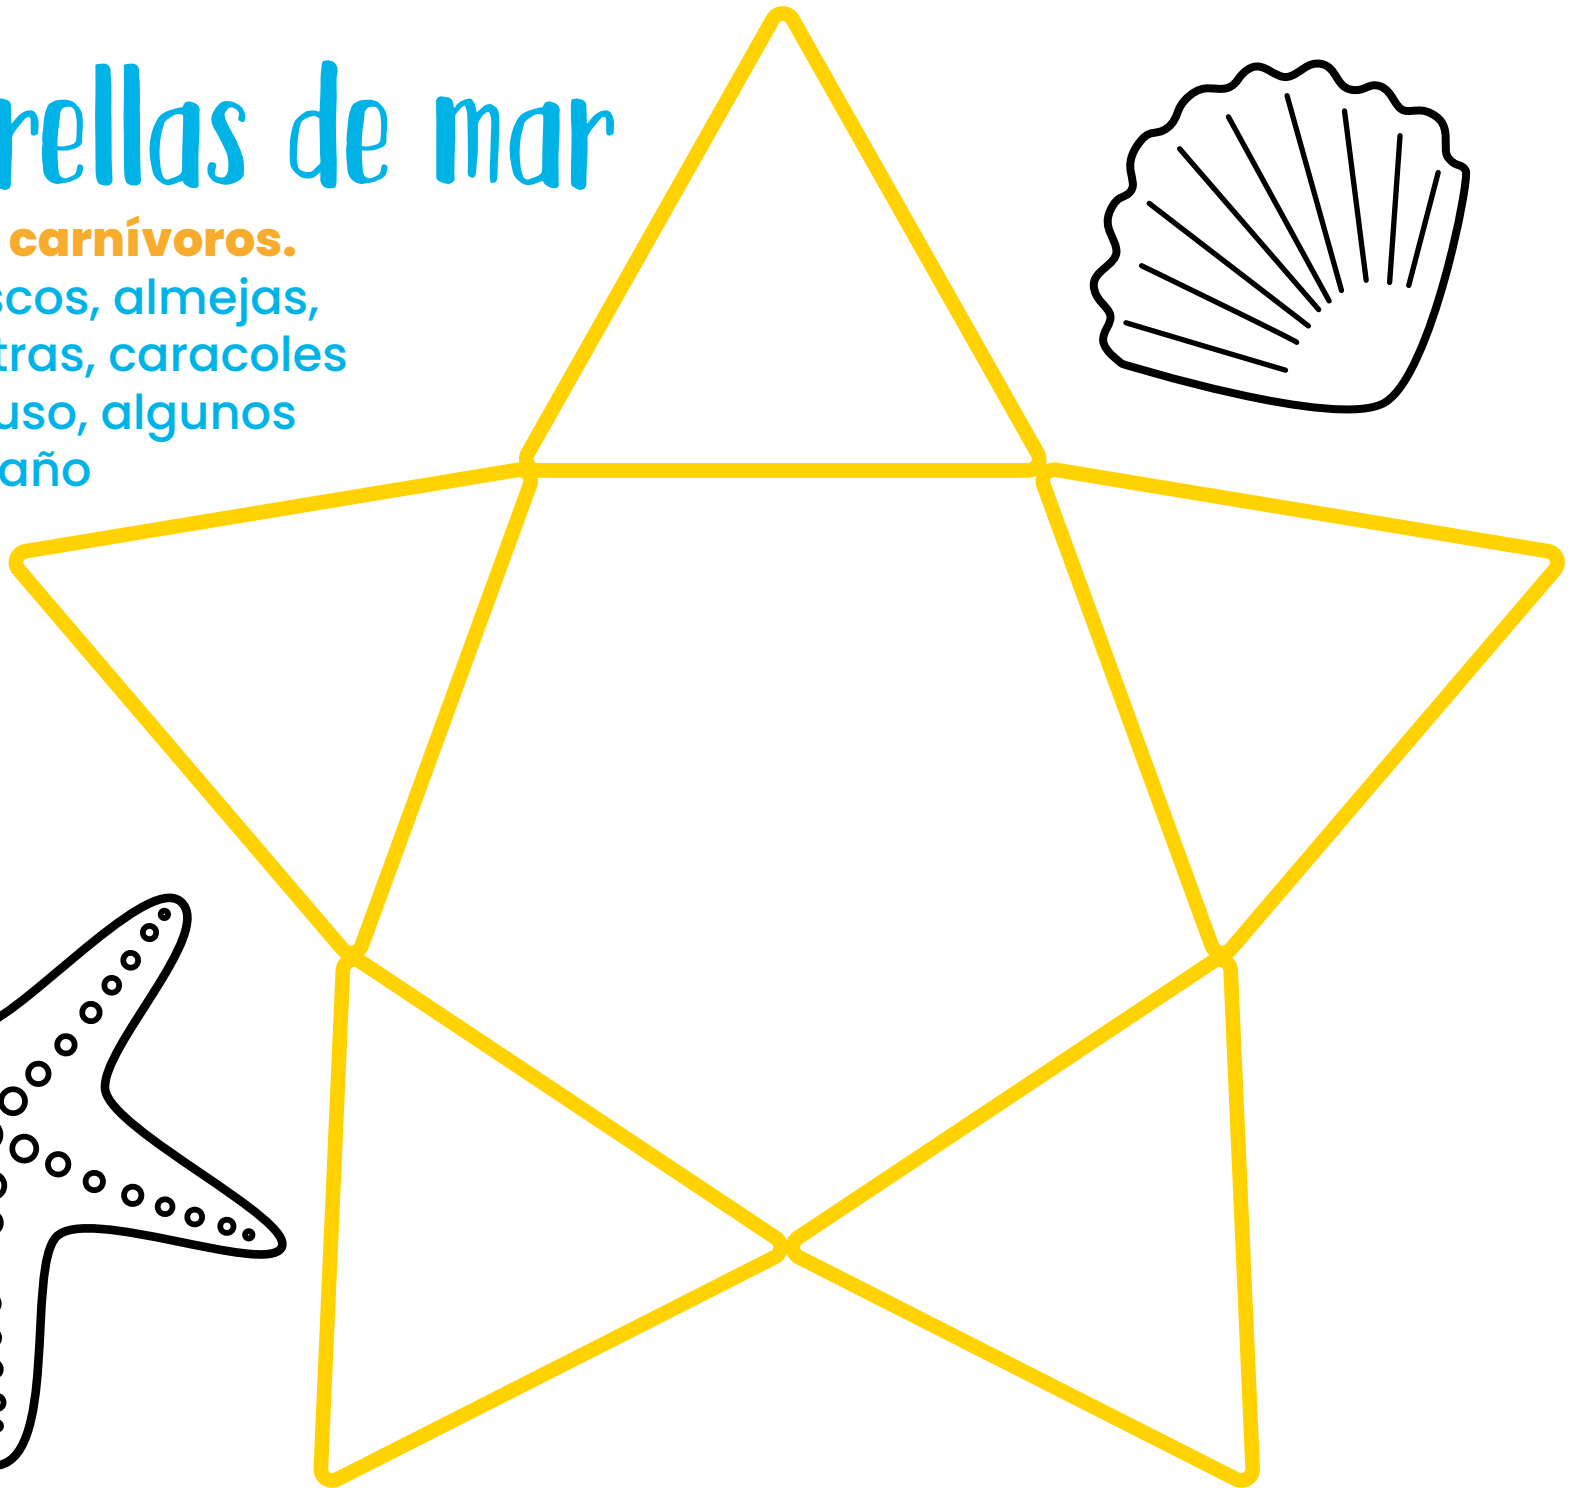

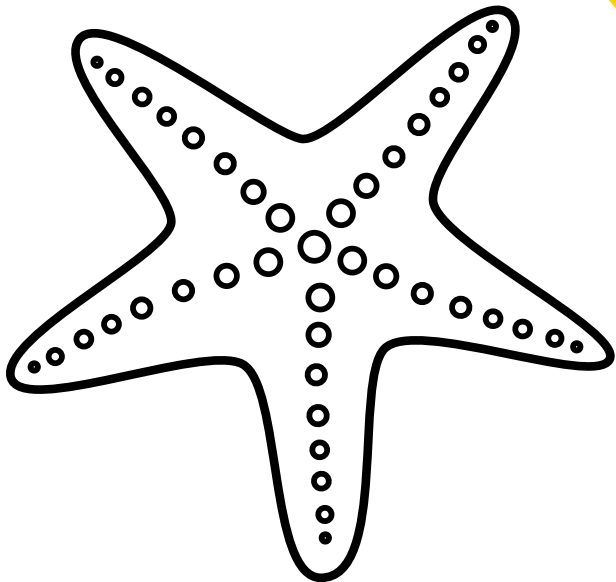

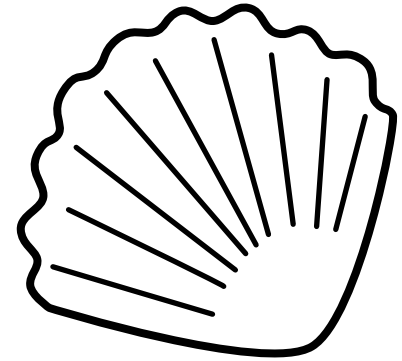

Están entre las especies **más inteligentes** que habitan en el planeta tierra.

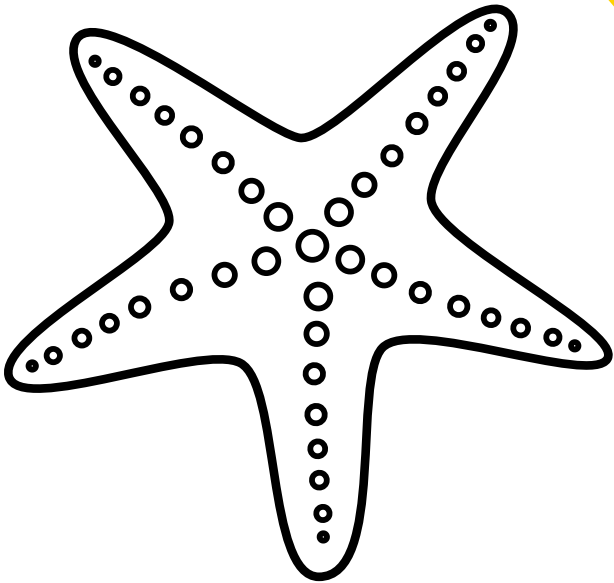

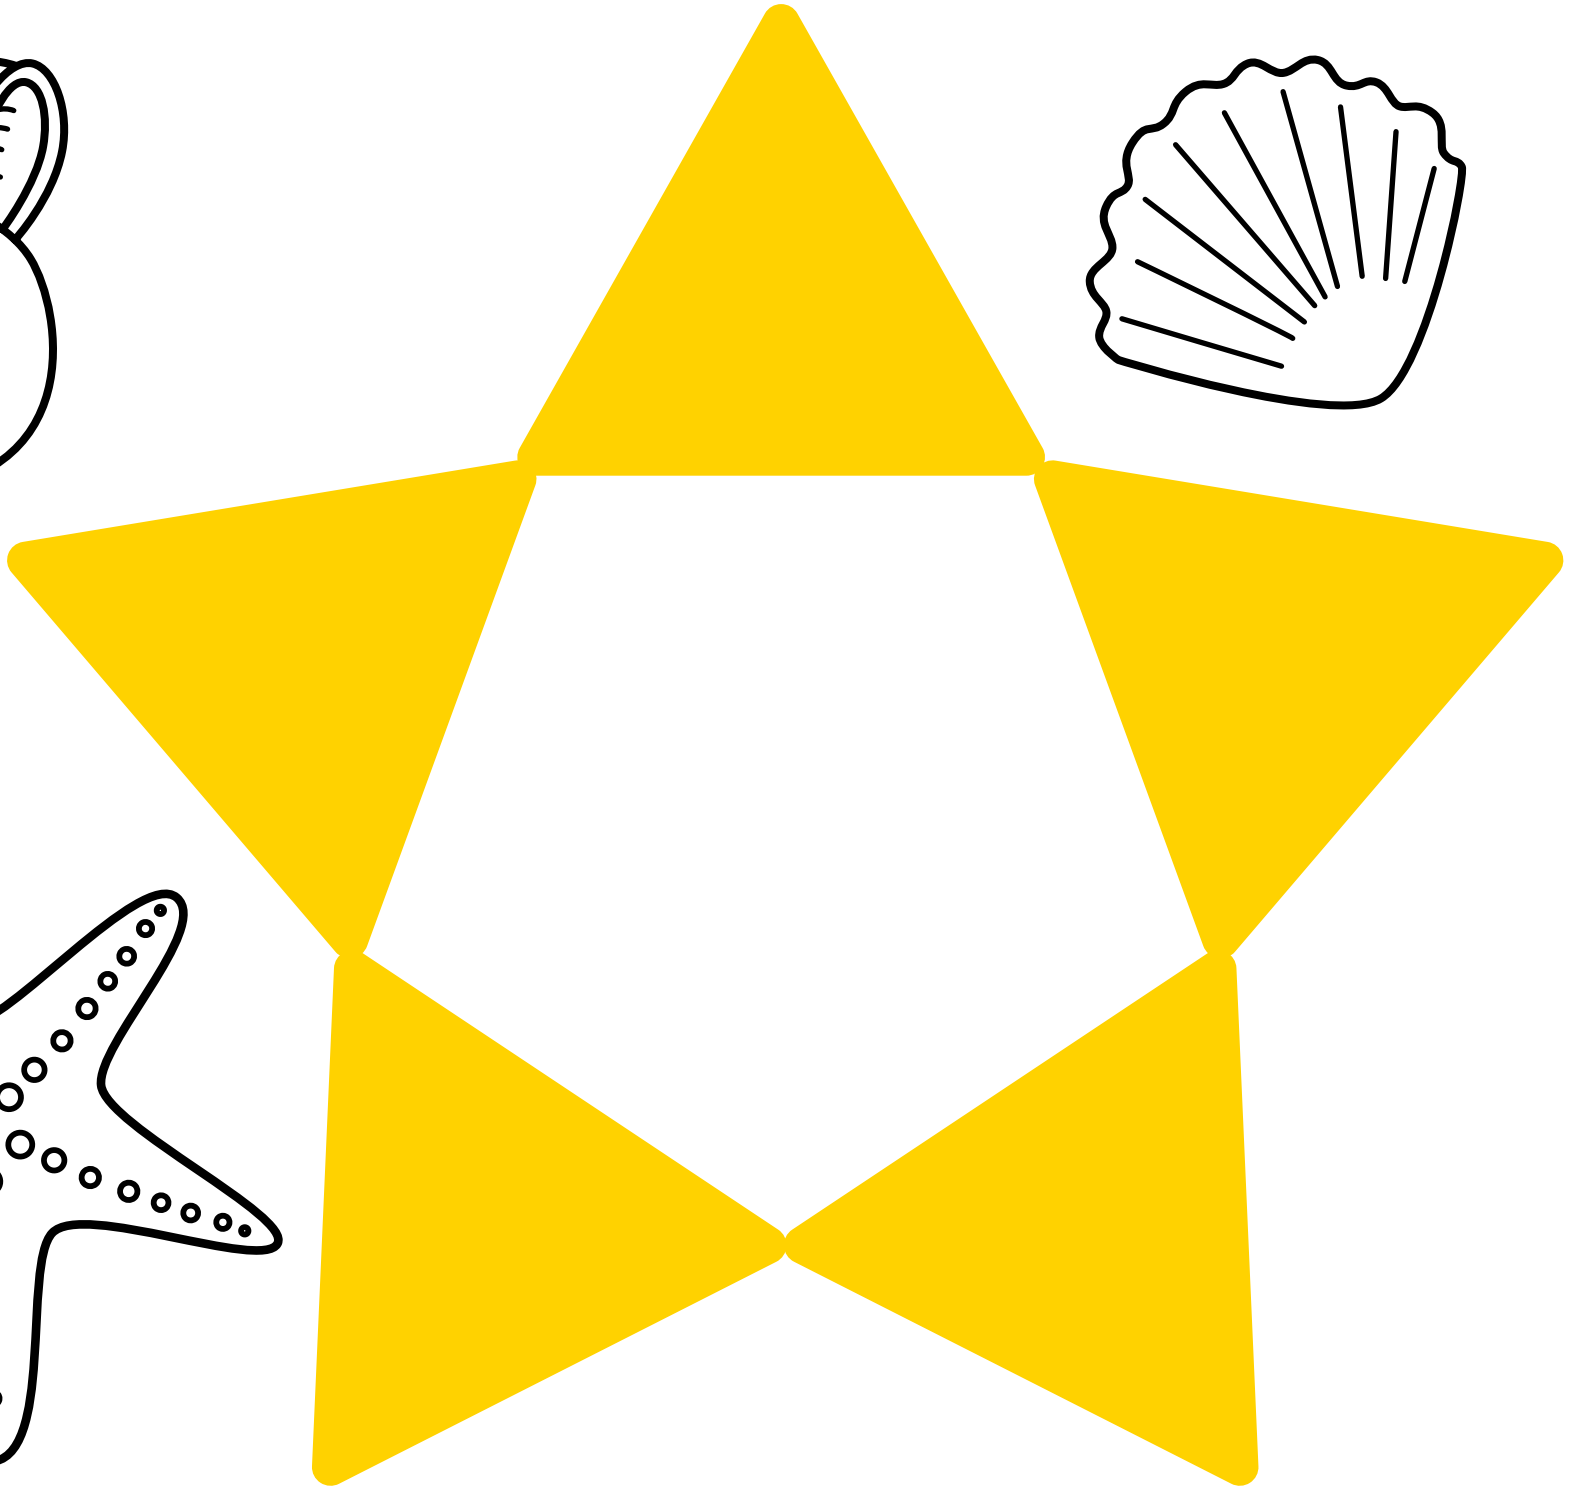

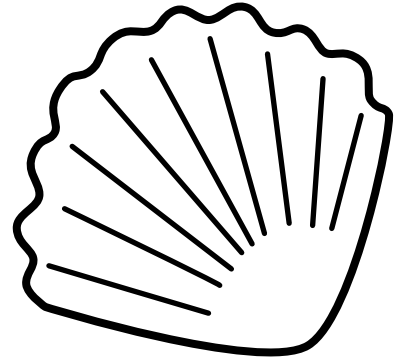

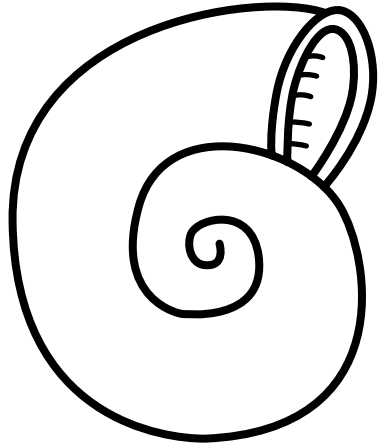

Las estrellas de mar

son animales carnívoros.

Comen moluscos, almejas, mejillones, ostras, caracoles de mar, e incluso, algunos peces de tamaño pequeño.

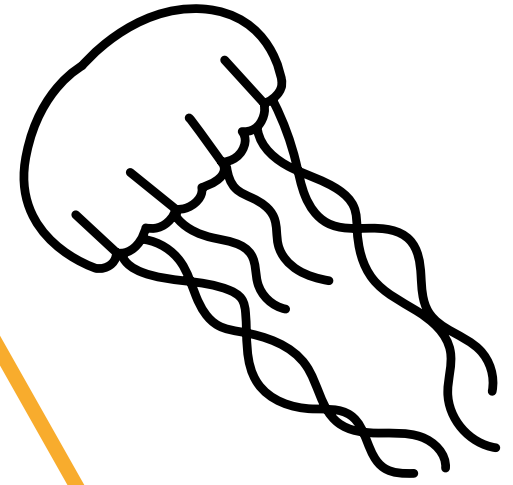

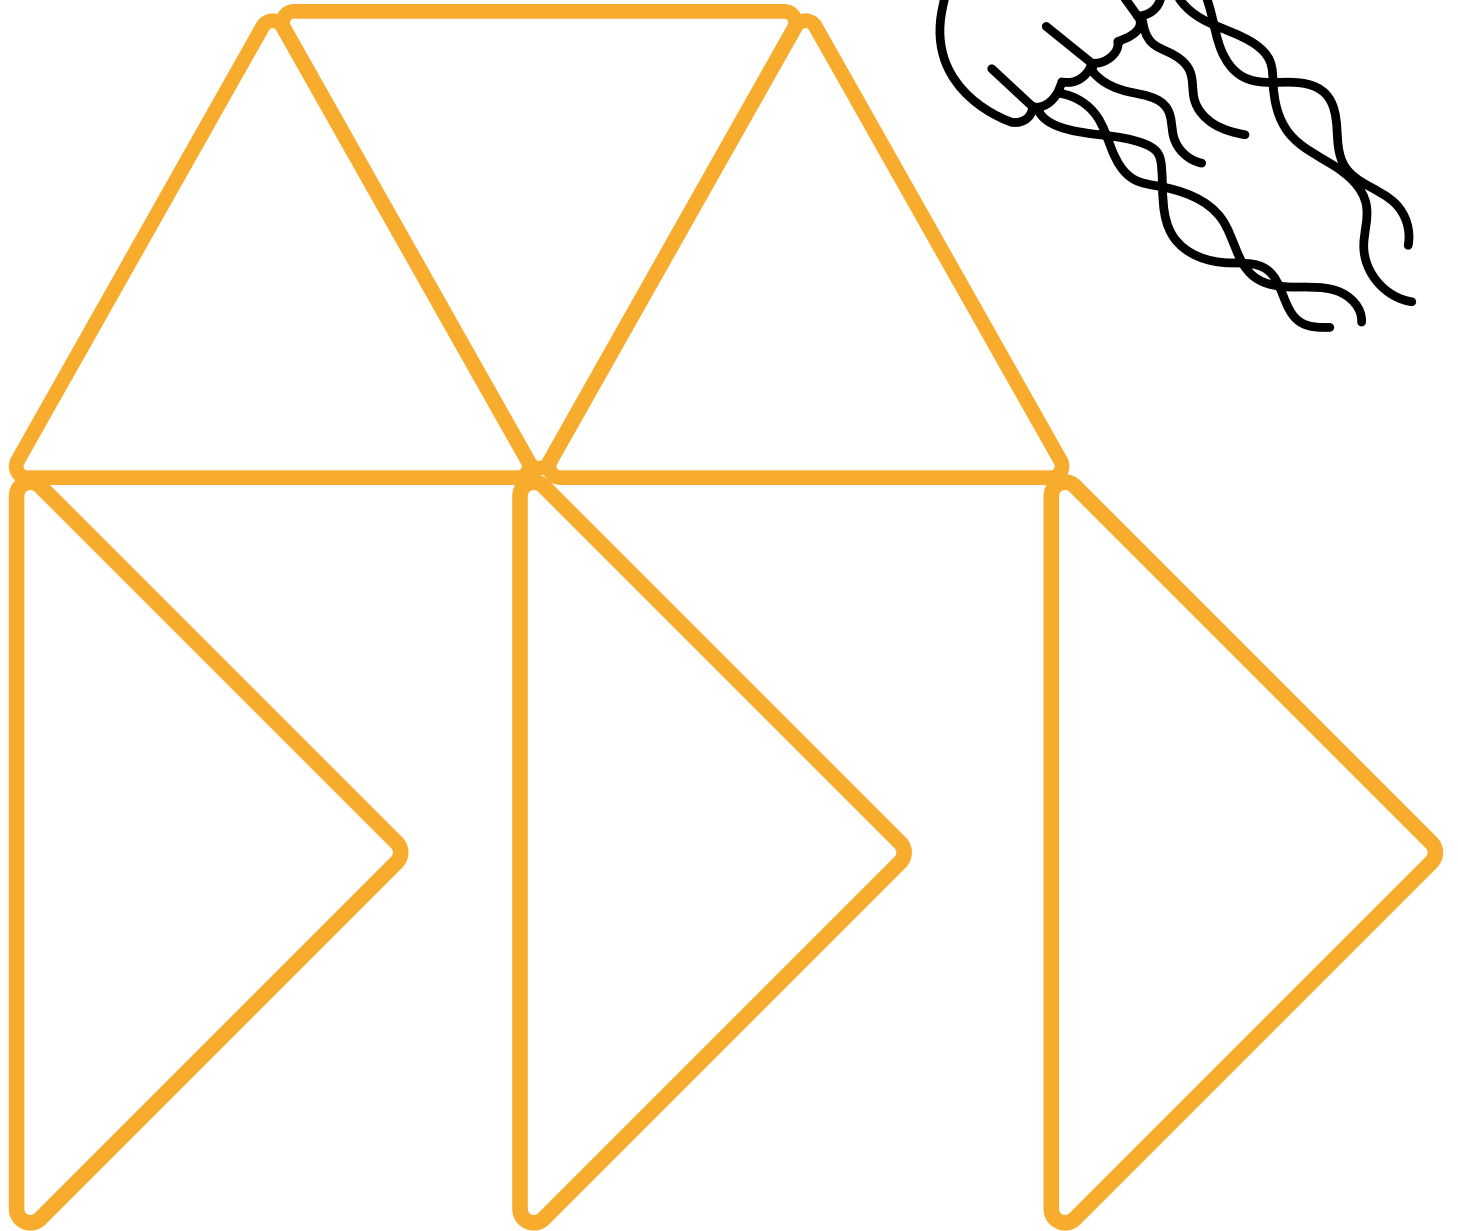

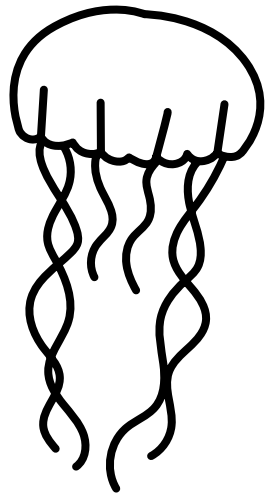

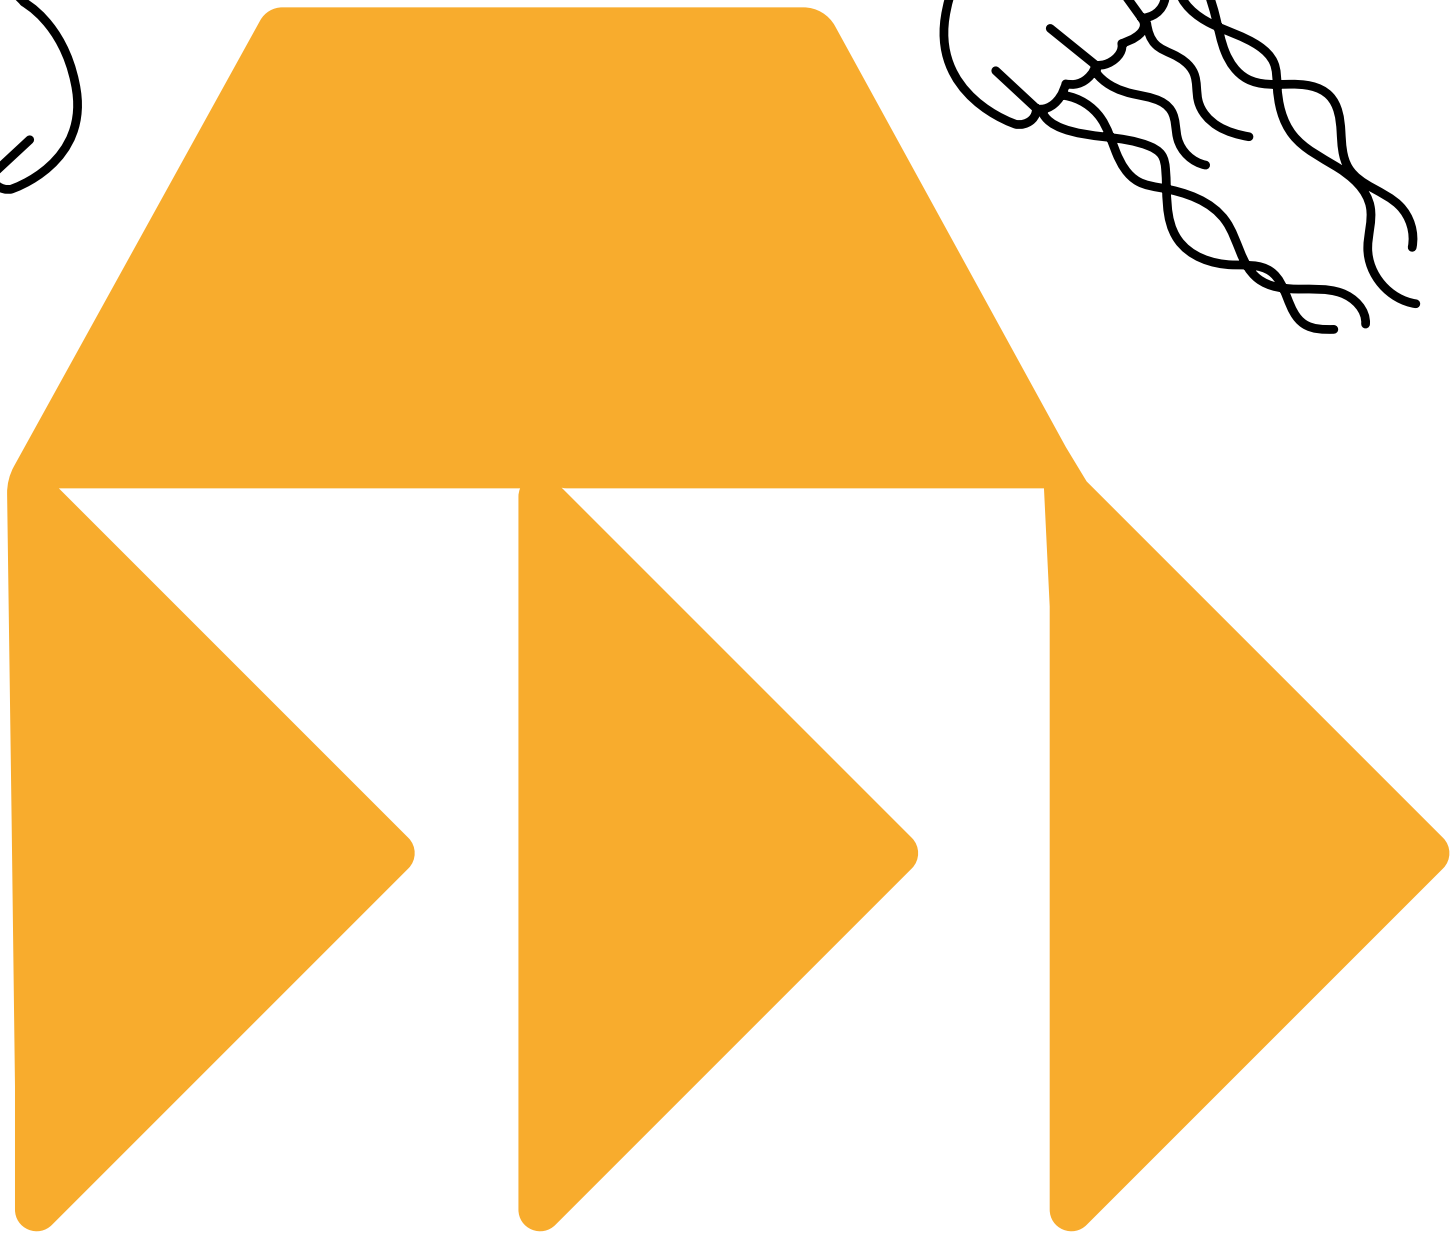

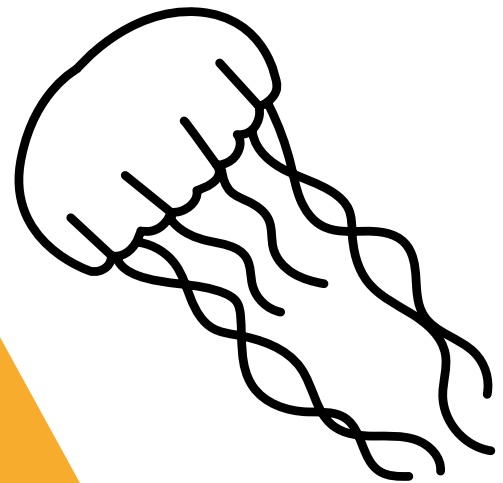

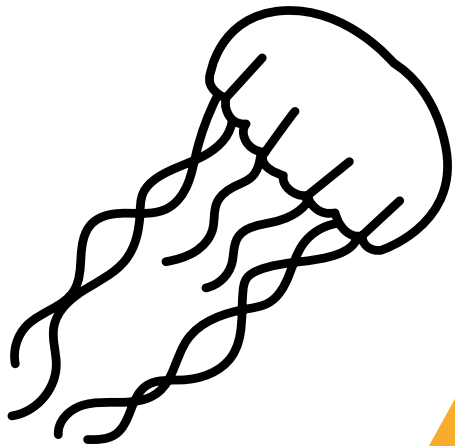

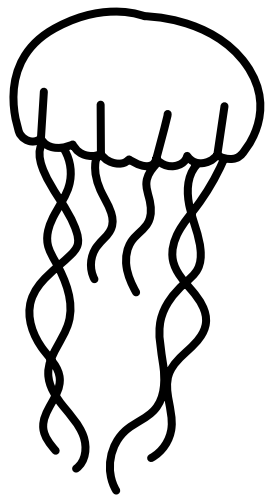

Las medusas

tienen cuerpo

GELATINOSO

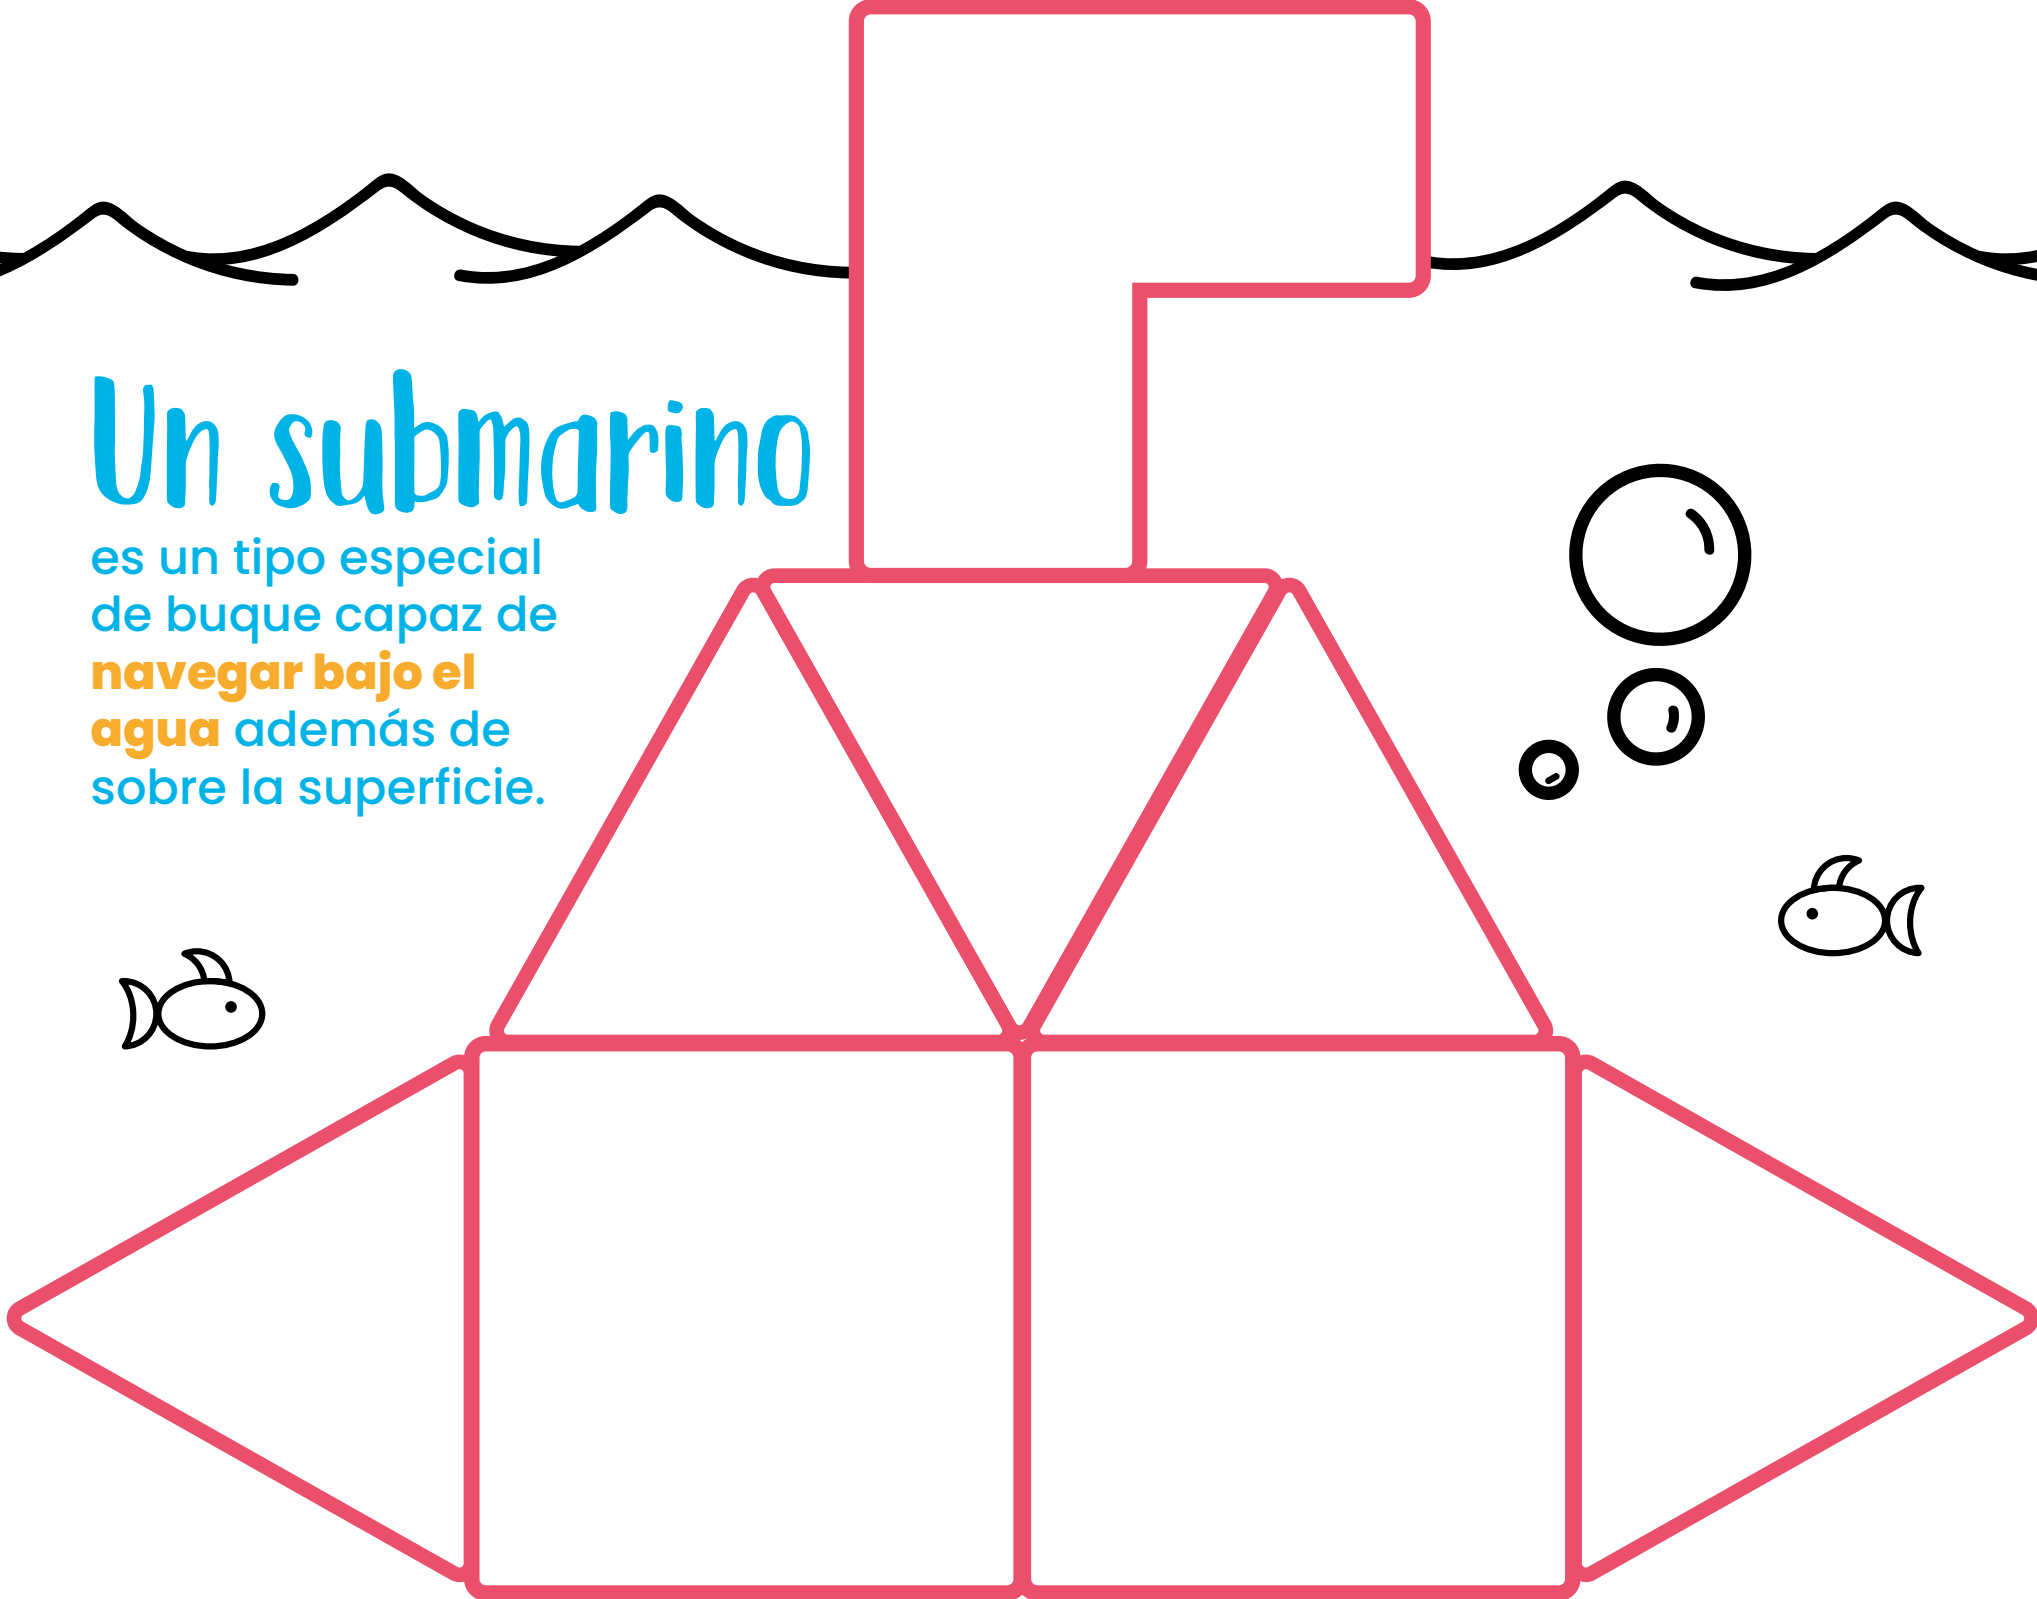

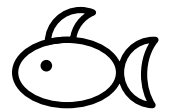

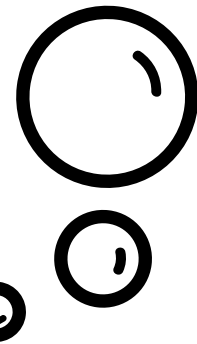

y utilizan sus
tentáculos para
inmovilizar y
capturar a sus
presas con las
toxinas que
liberan.

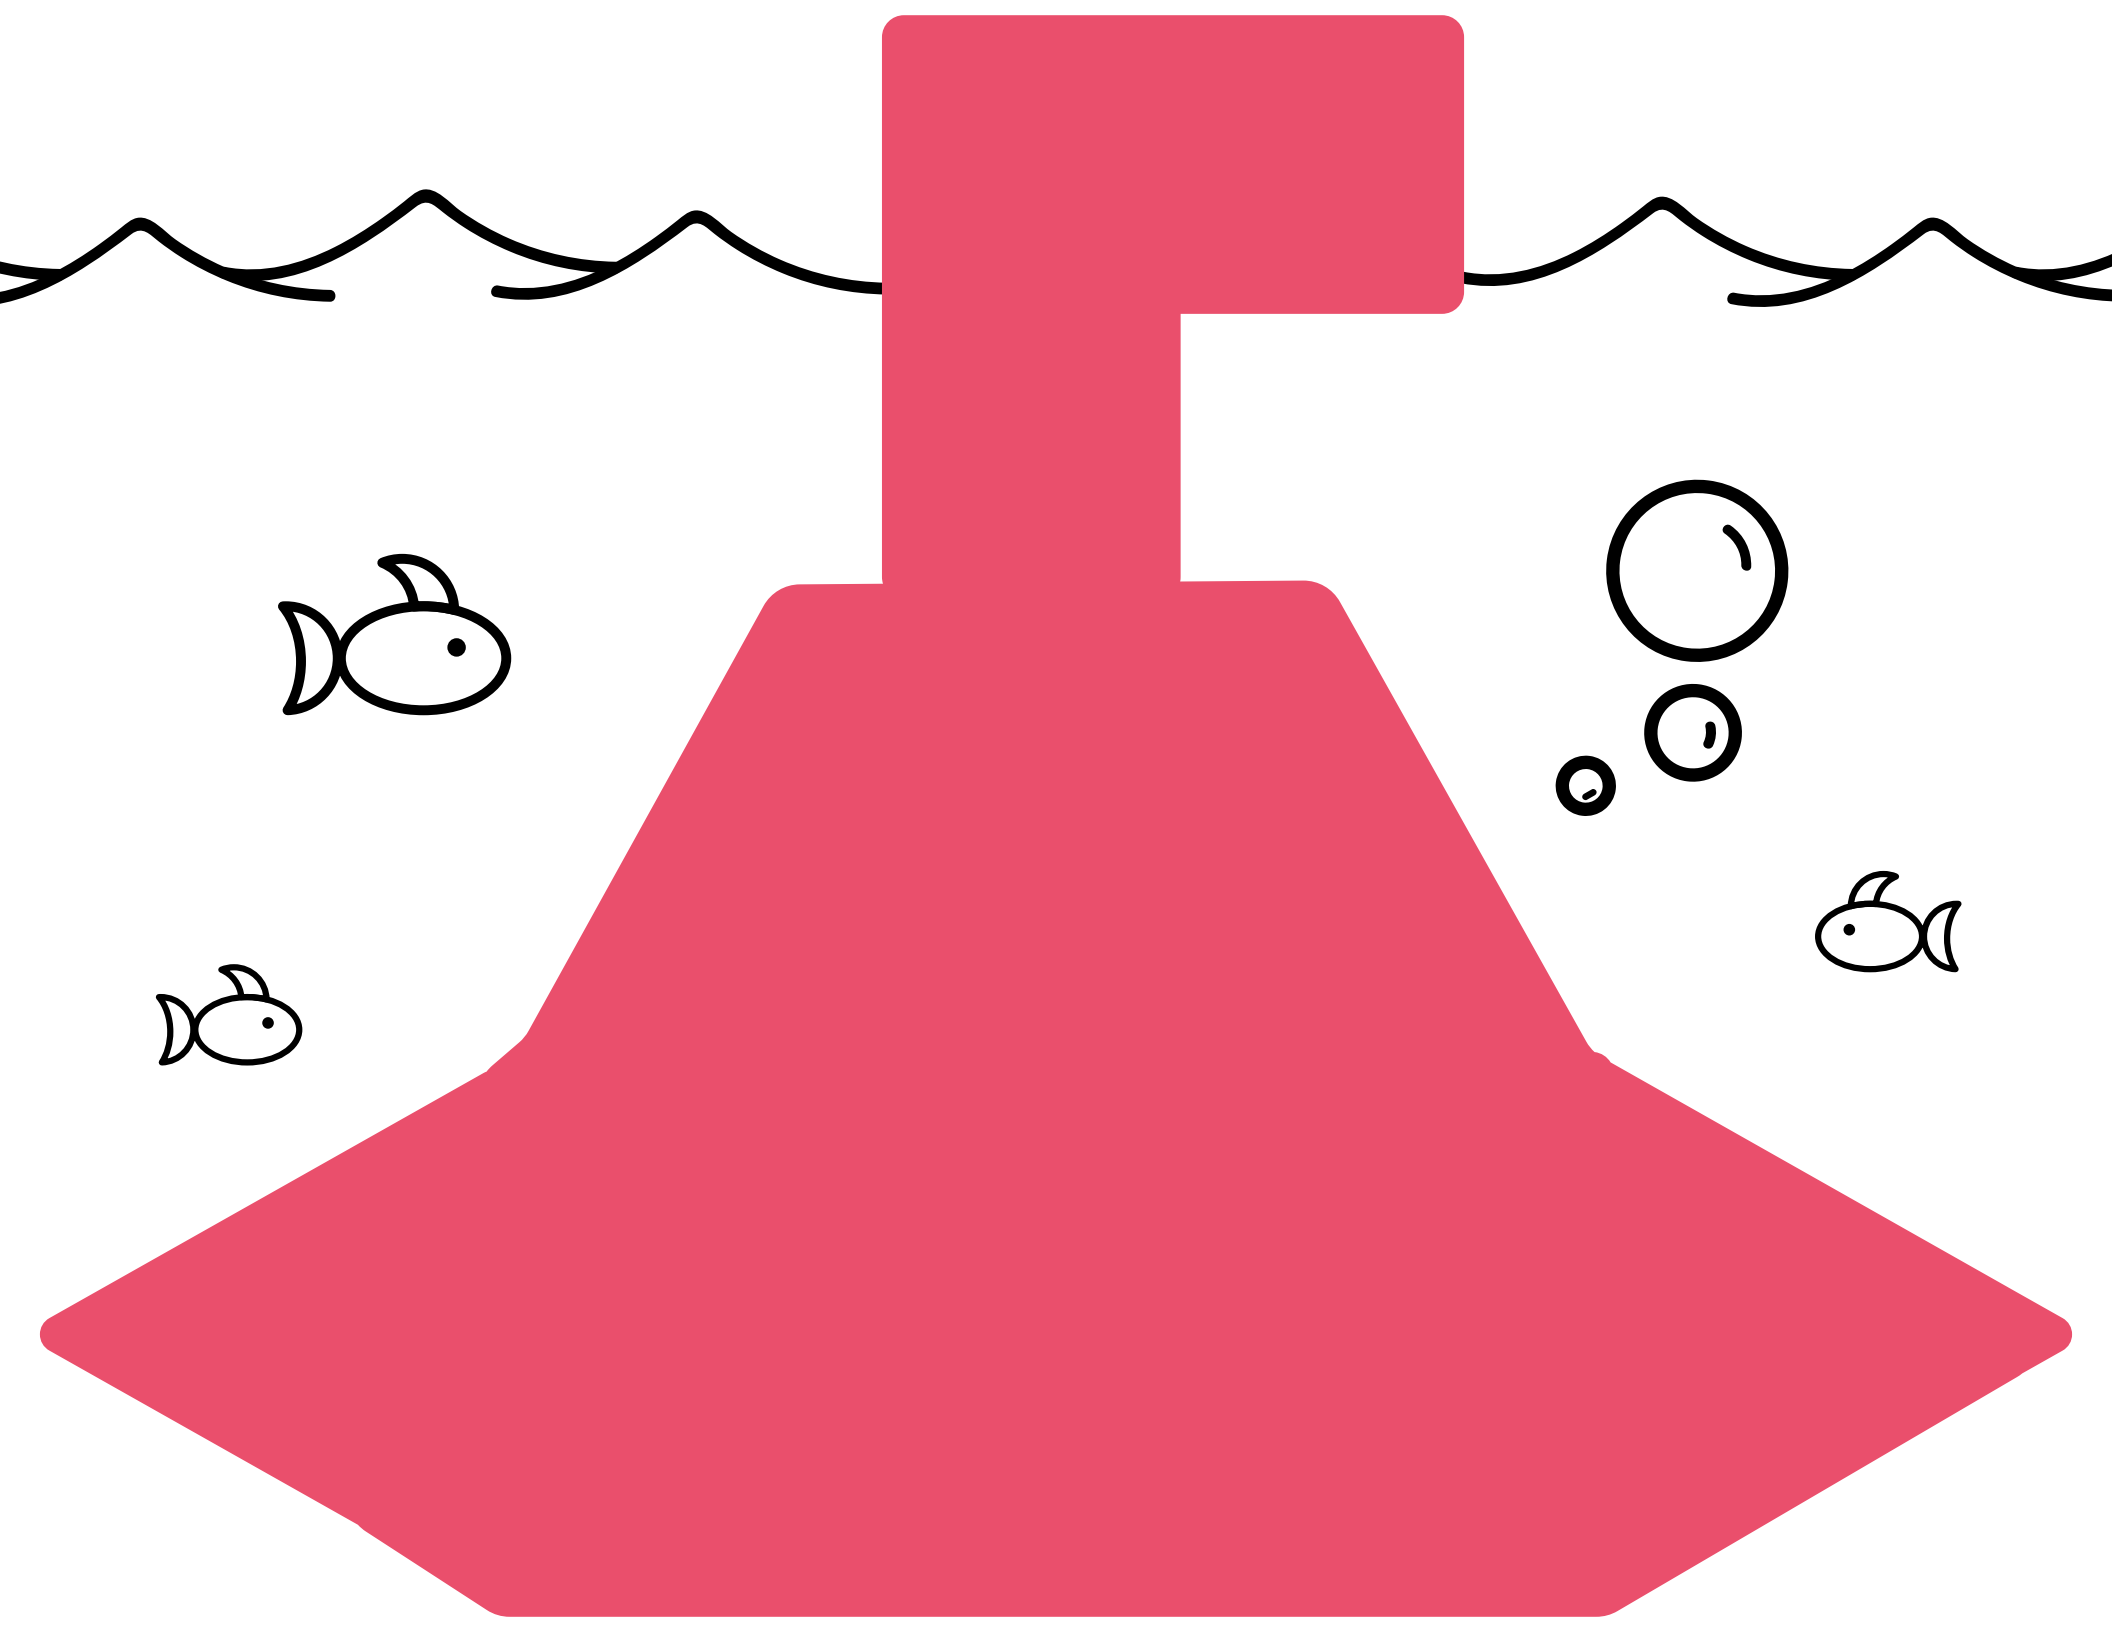

Un submarino

es un tipo especial de buque capaz de **navegar bajo el agua** además de sobre la superficie.

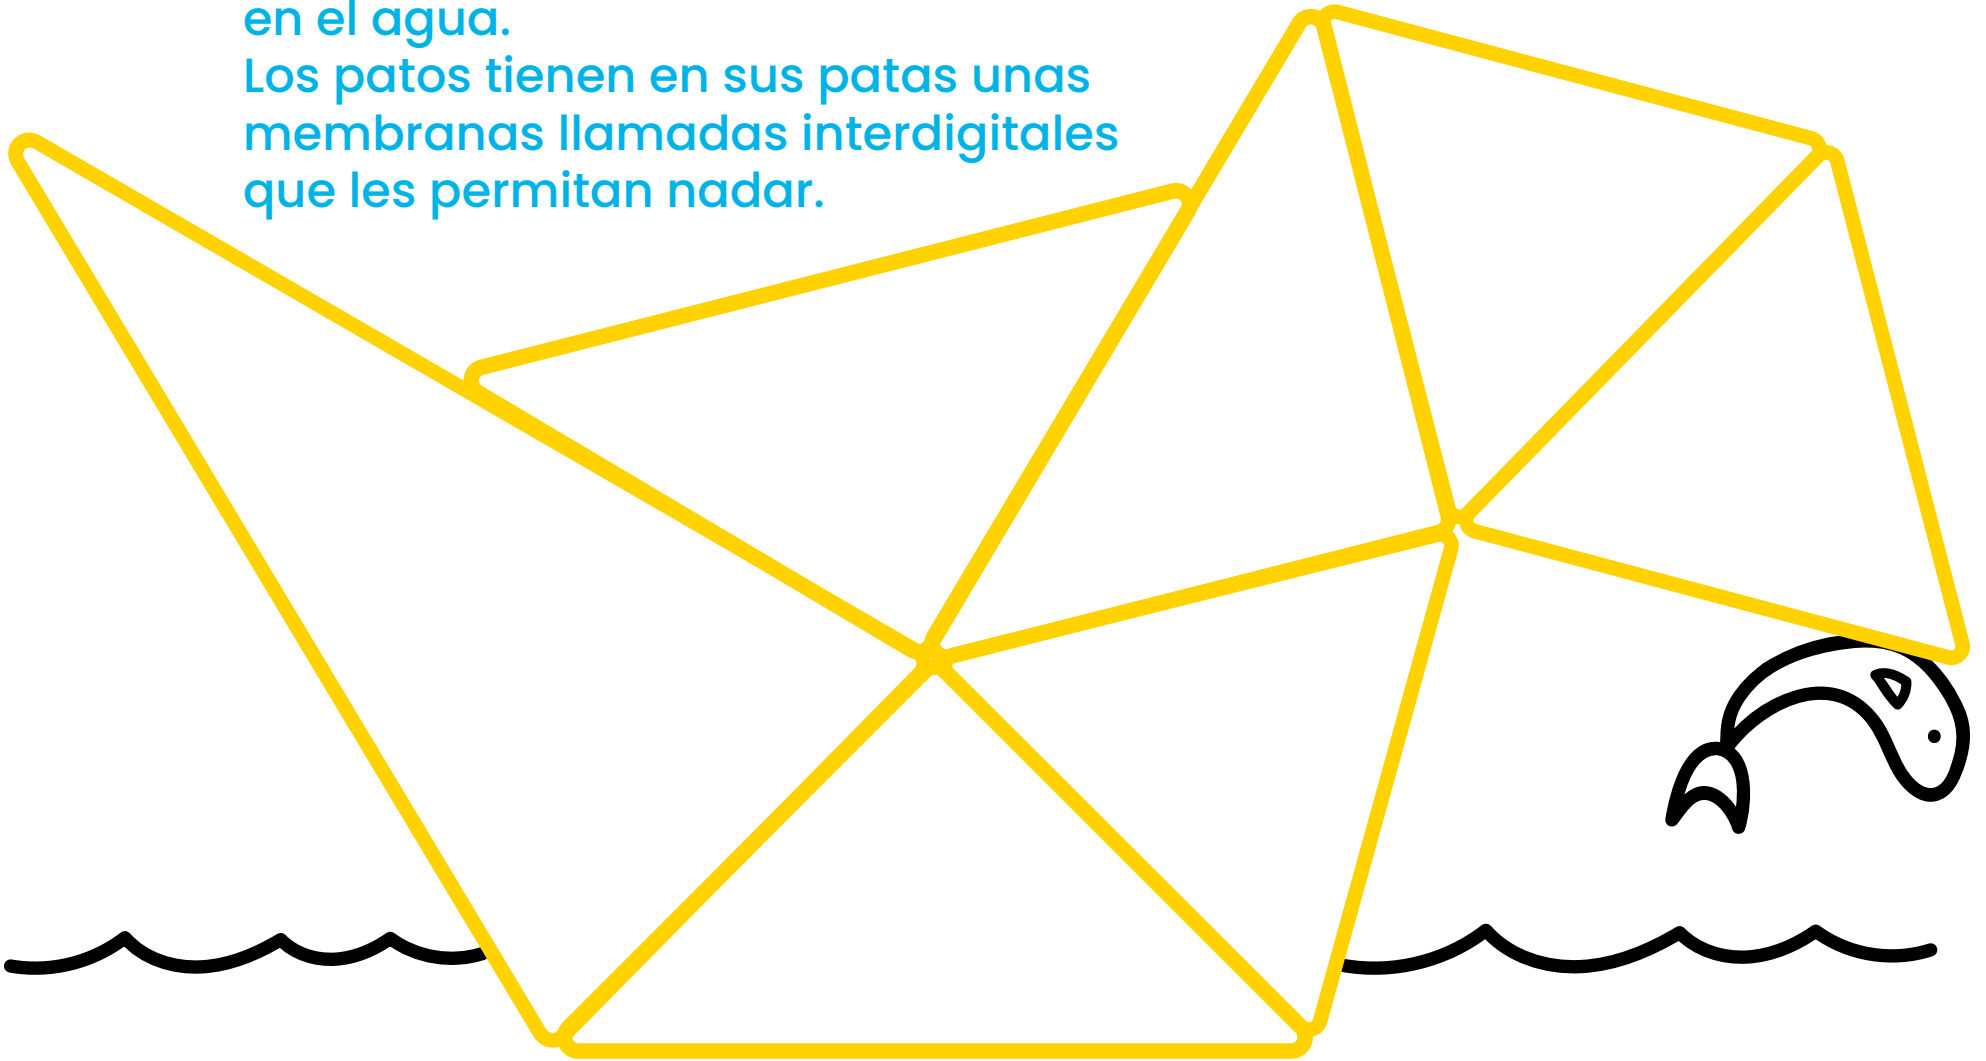

Los patos

son aves muy sociales a las que les gusta mantenerse en suelo firme y también en el agua.

Los patos tienen en sus patas unas membranas llamadas interdigitales que les permitan nadar.

Los pelicanos

se caracterizan por su enorme pico y la gran bolsa que llevan en éste. Esta **bolsa la usan para la captura de sus presas** y el drenaje del agua recogida antes de tragárselas.

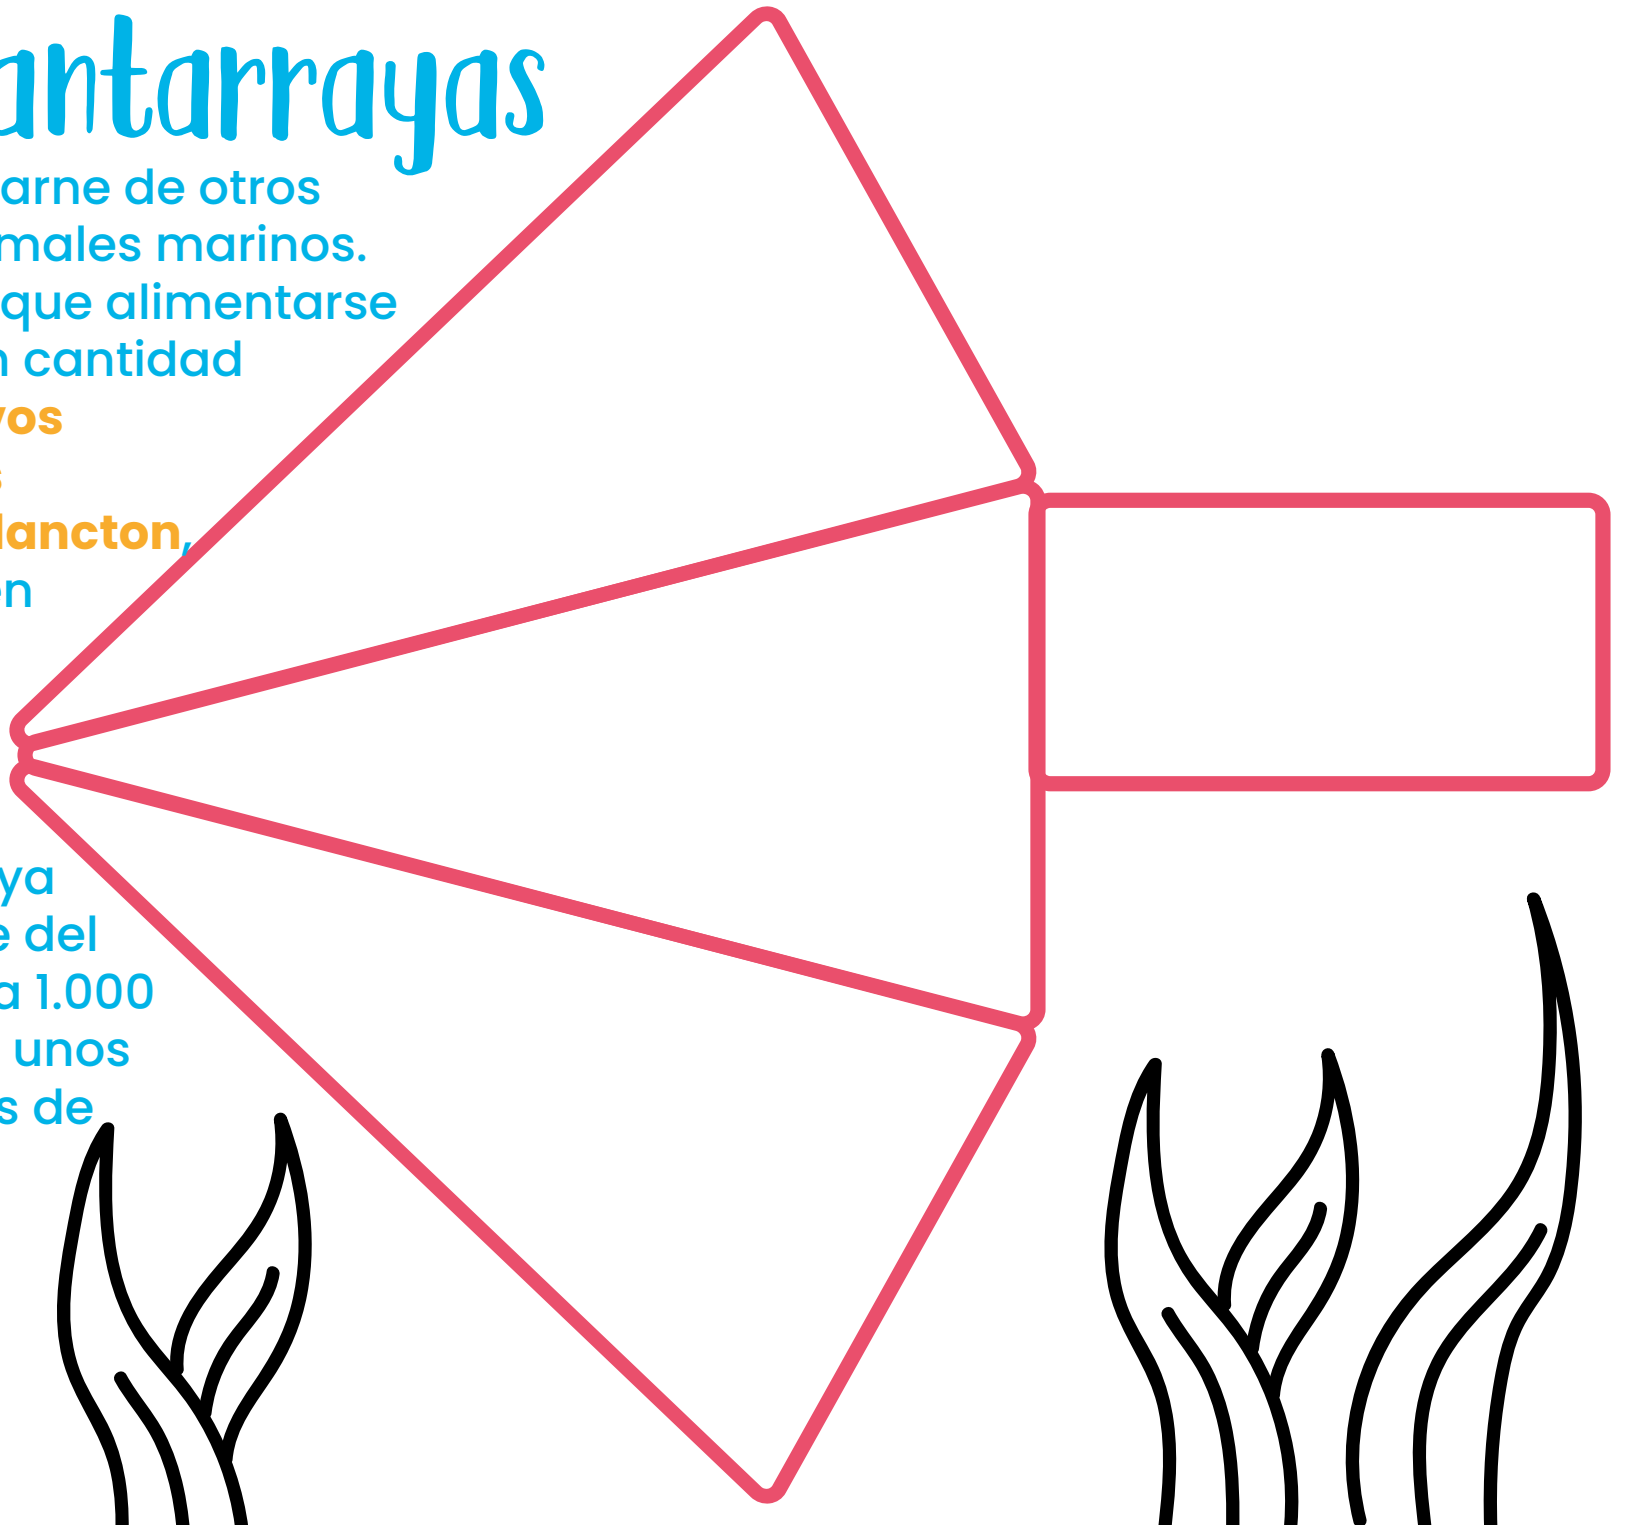

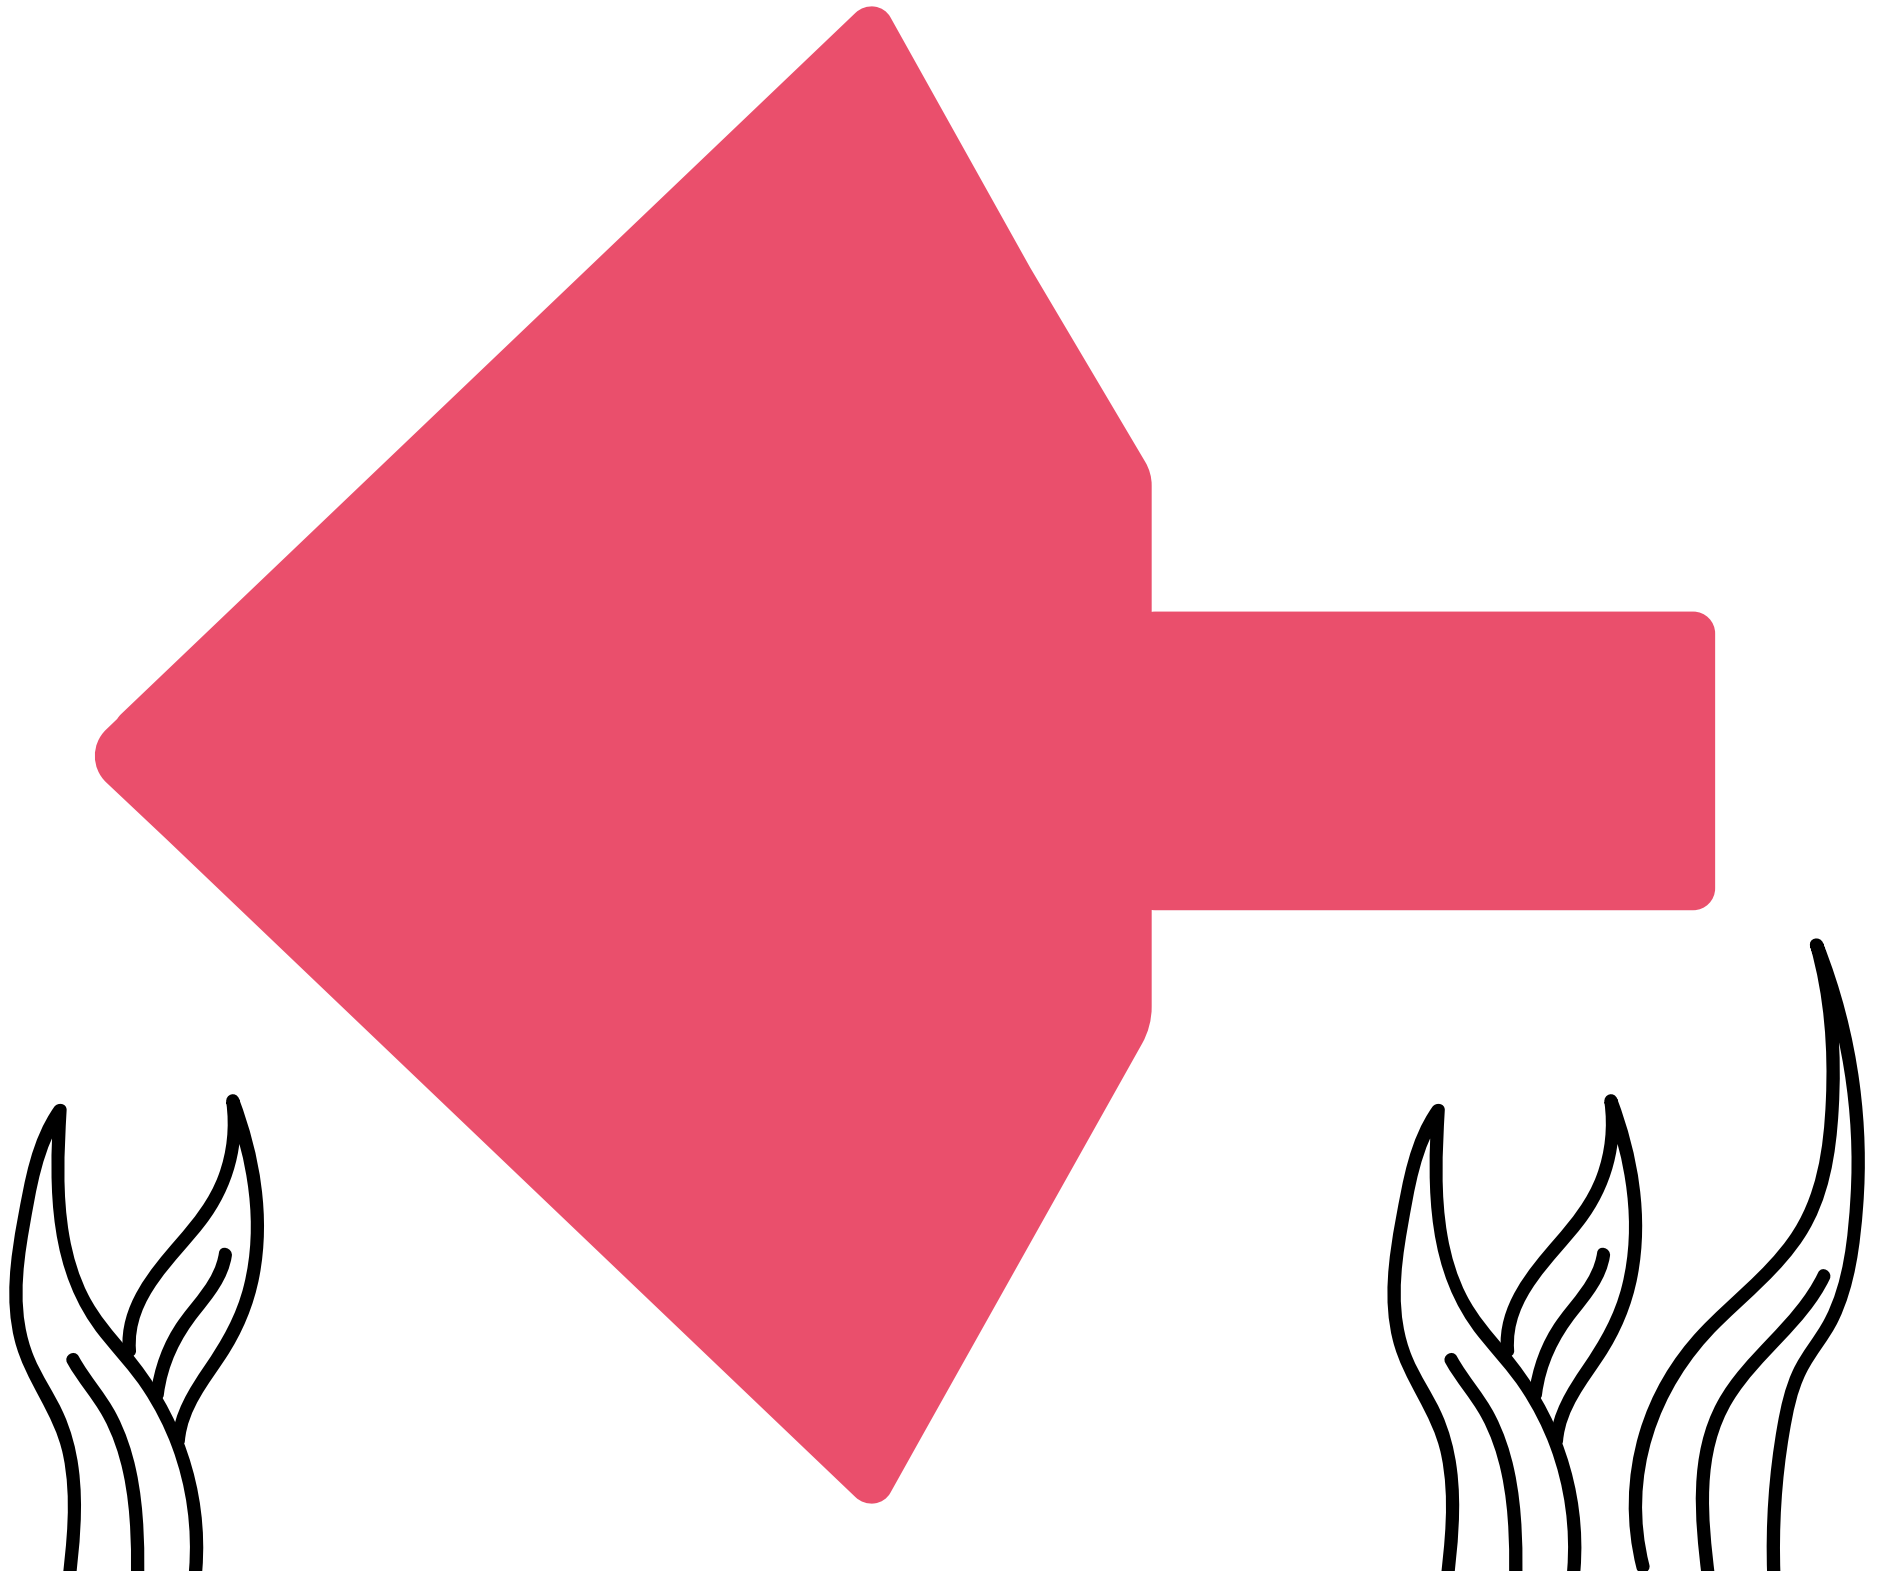

Las mantarrayas

no comen carne de otros peces o animales marinos. Ellas tienen que alimentarse de una gran cantidad de **seres vivos minúsculos** llamados **plancton**, que flotan en el agua.

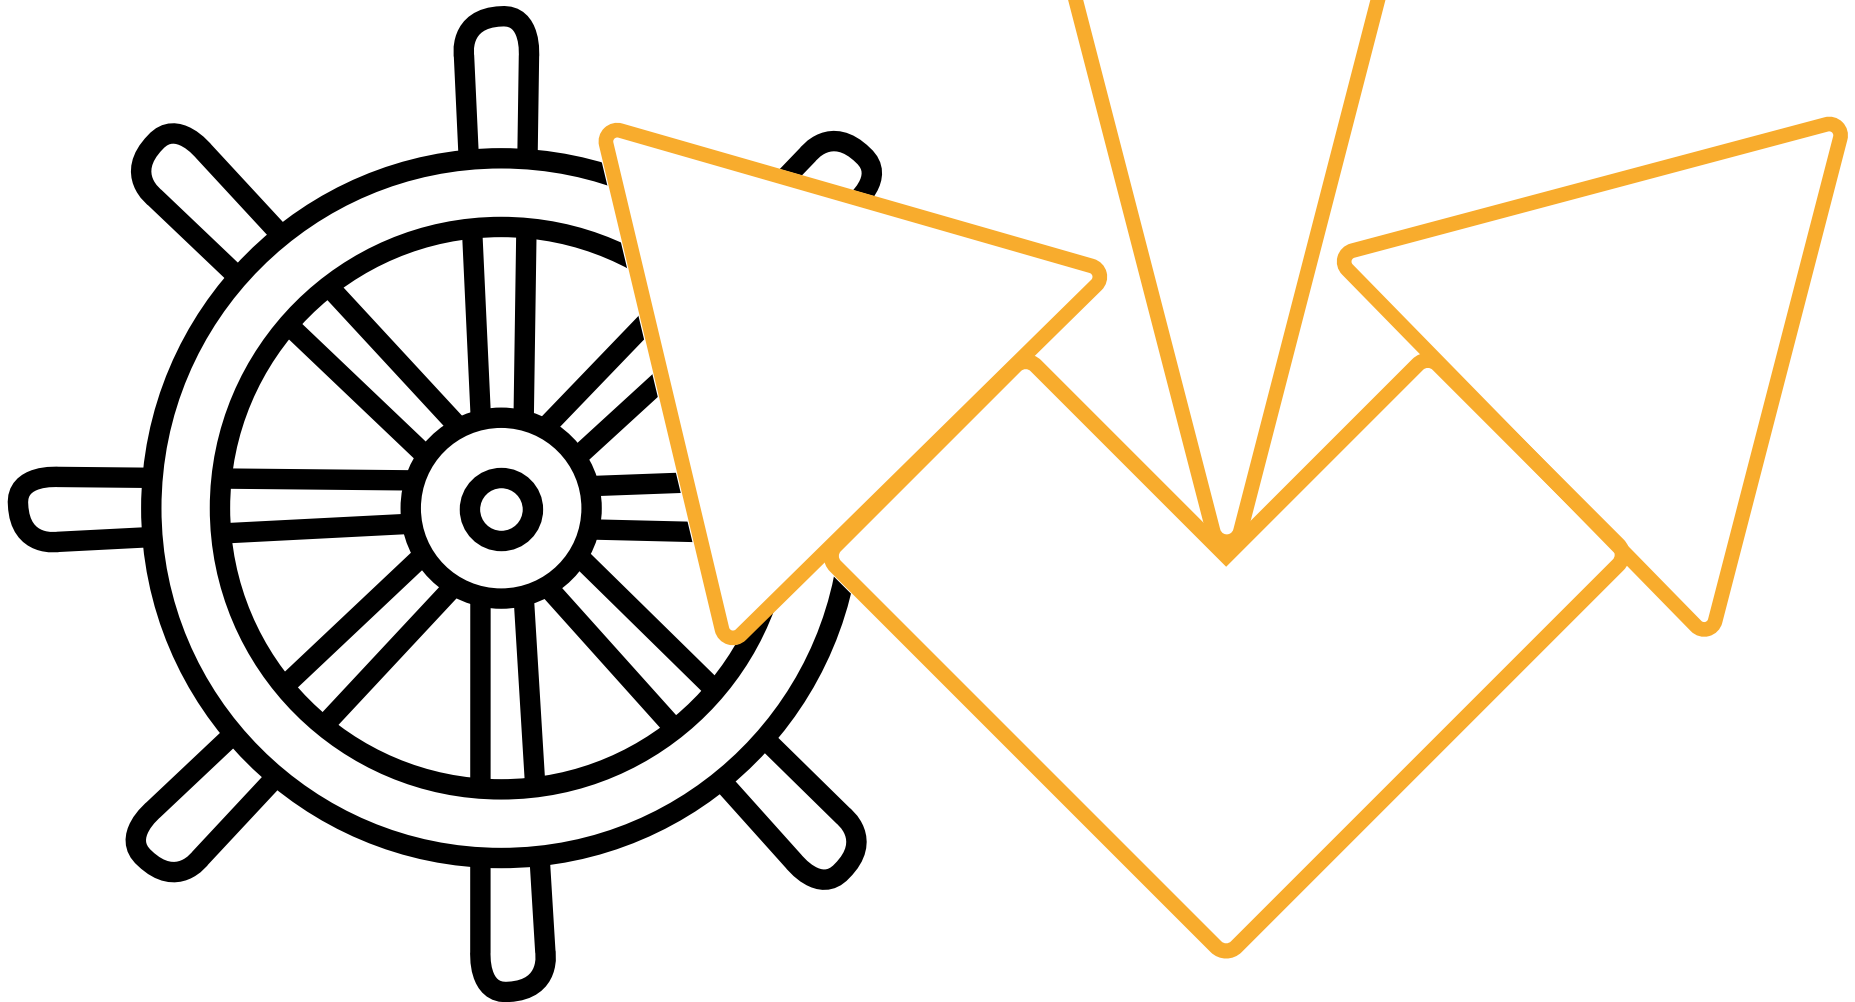

La mantaraya más grande del mundo pesa 1.000 kilos y mide unos ocho metros de longitud.

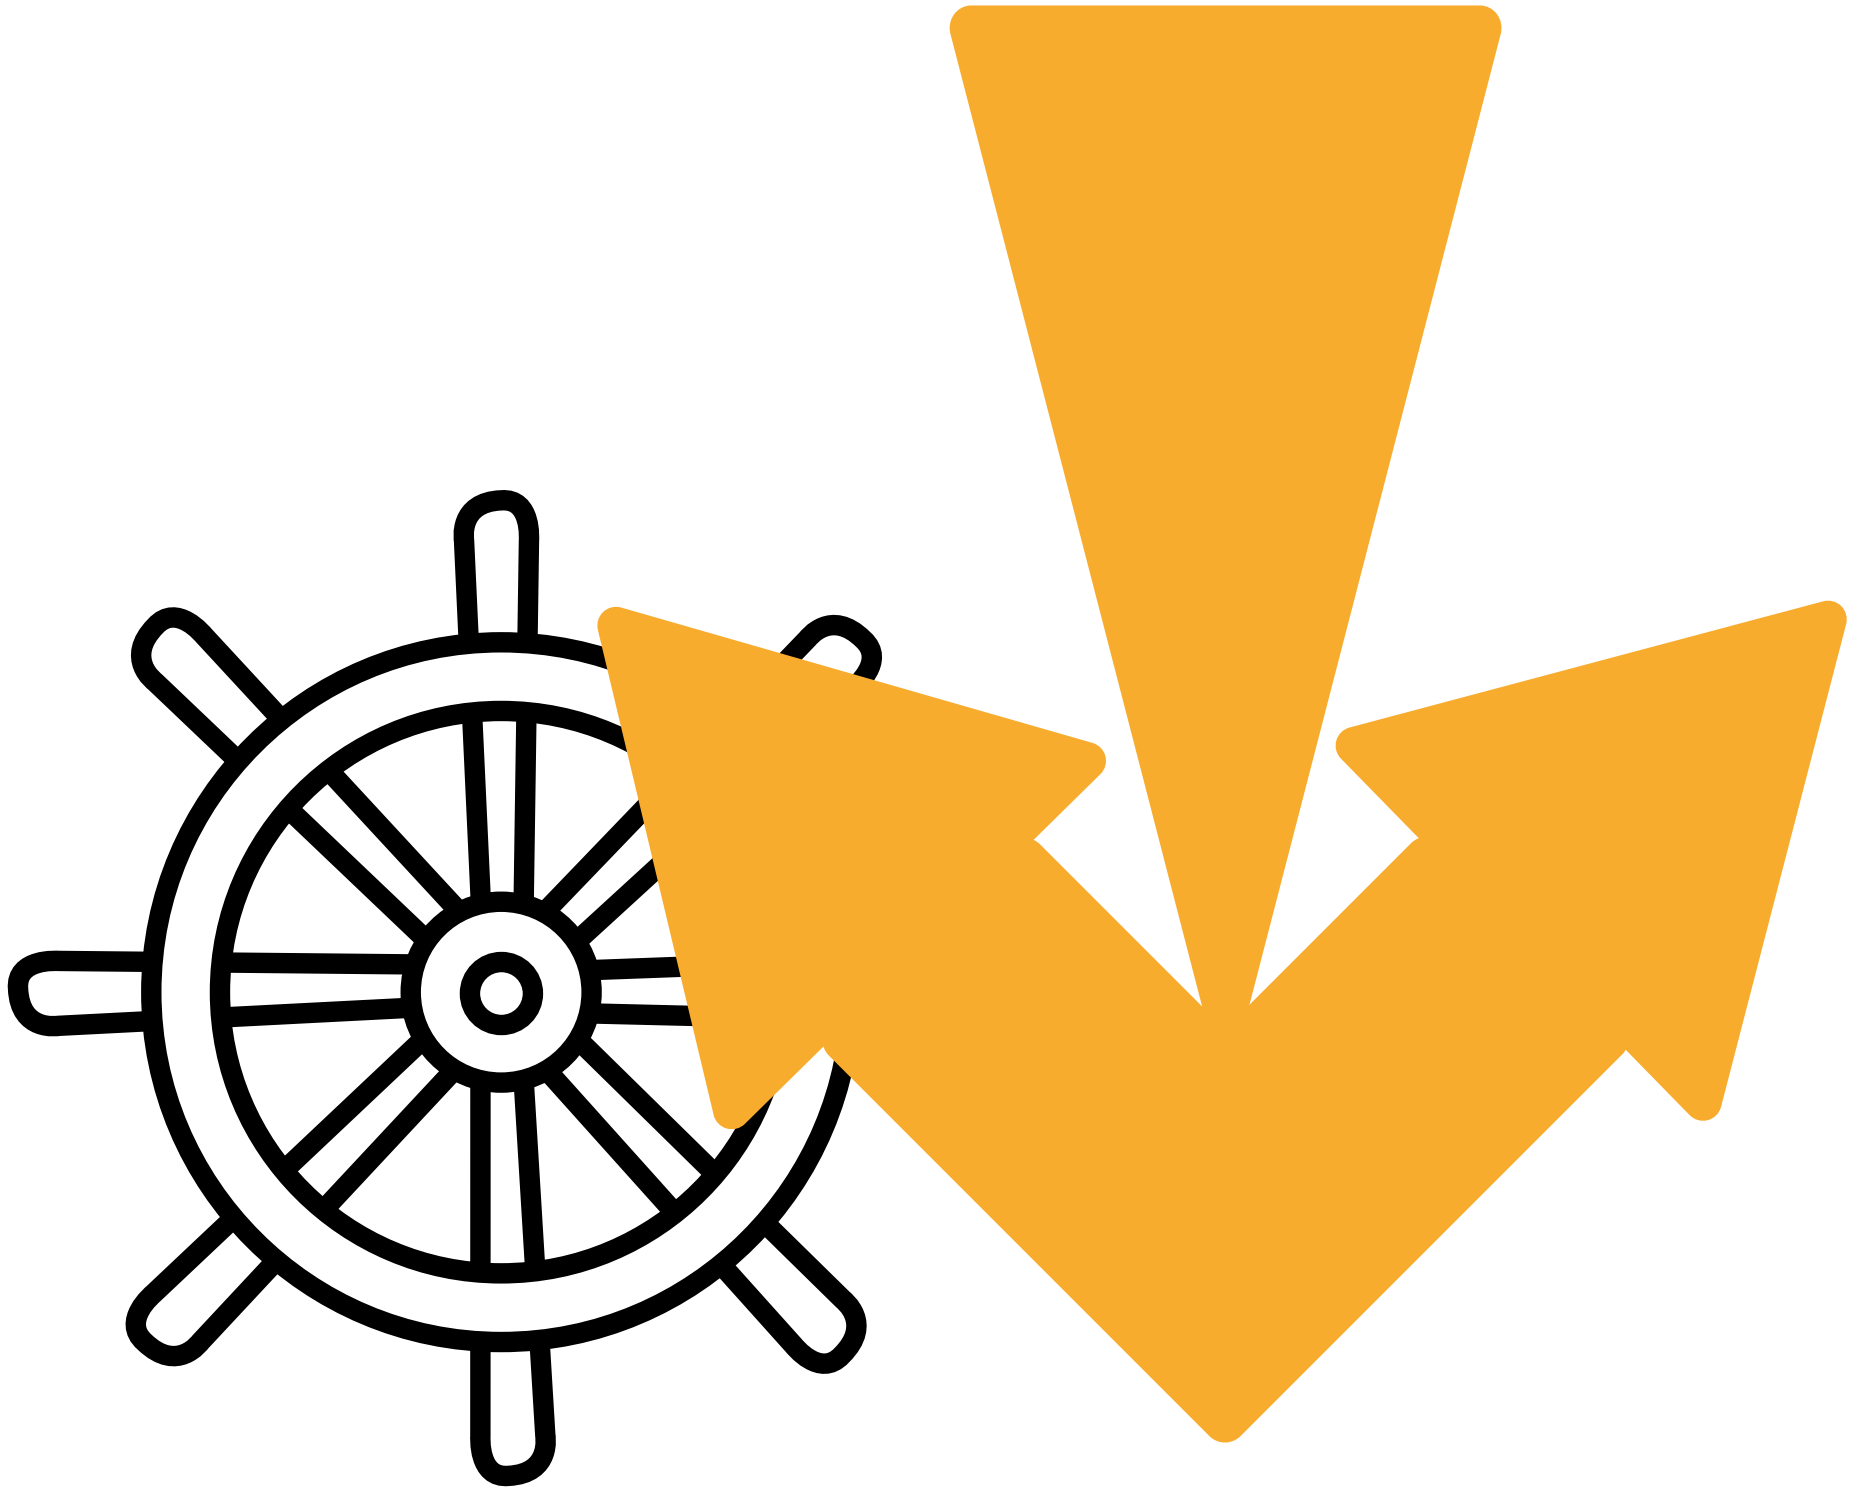

Las anclas

permite que los barcos se
afirmen fuertemente en el
fondo del mar.

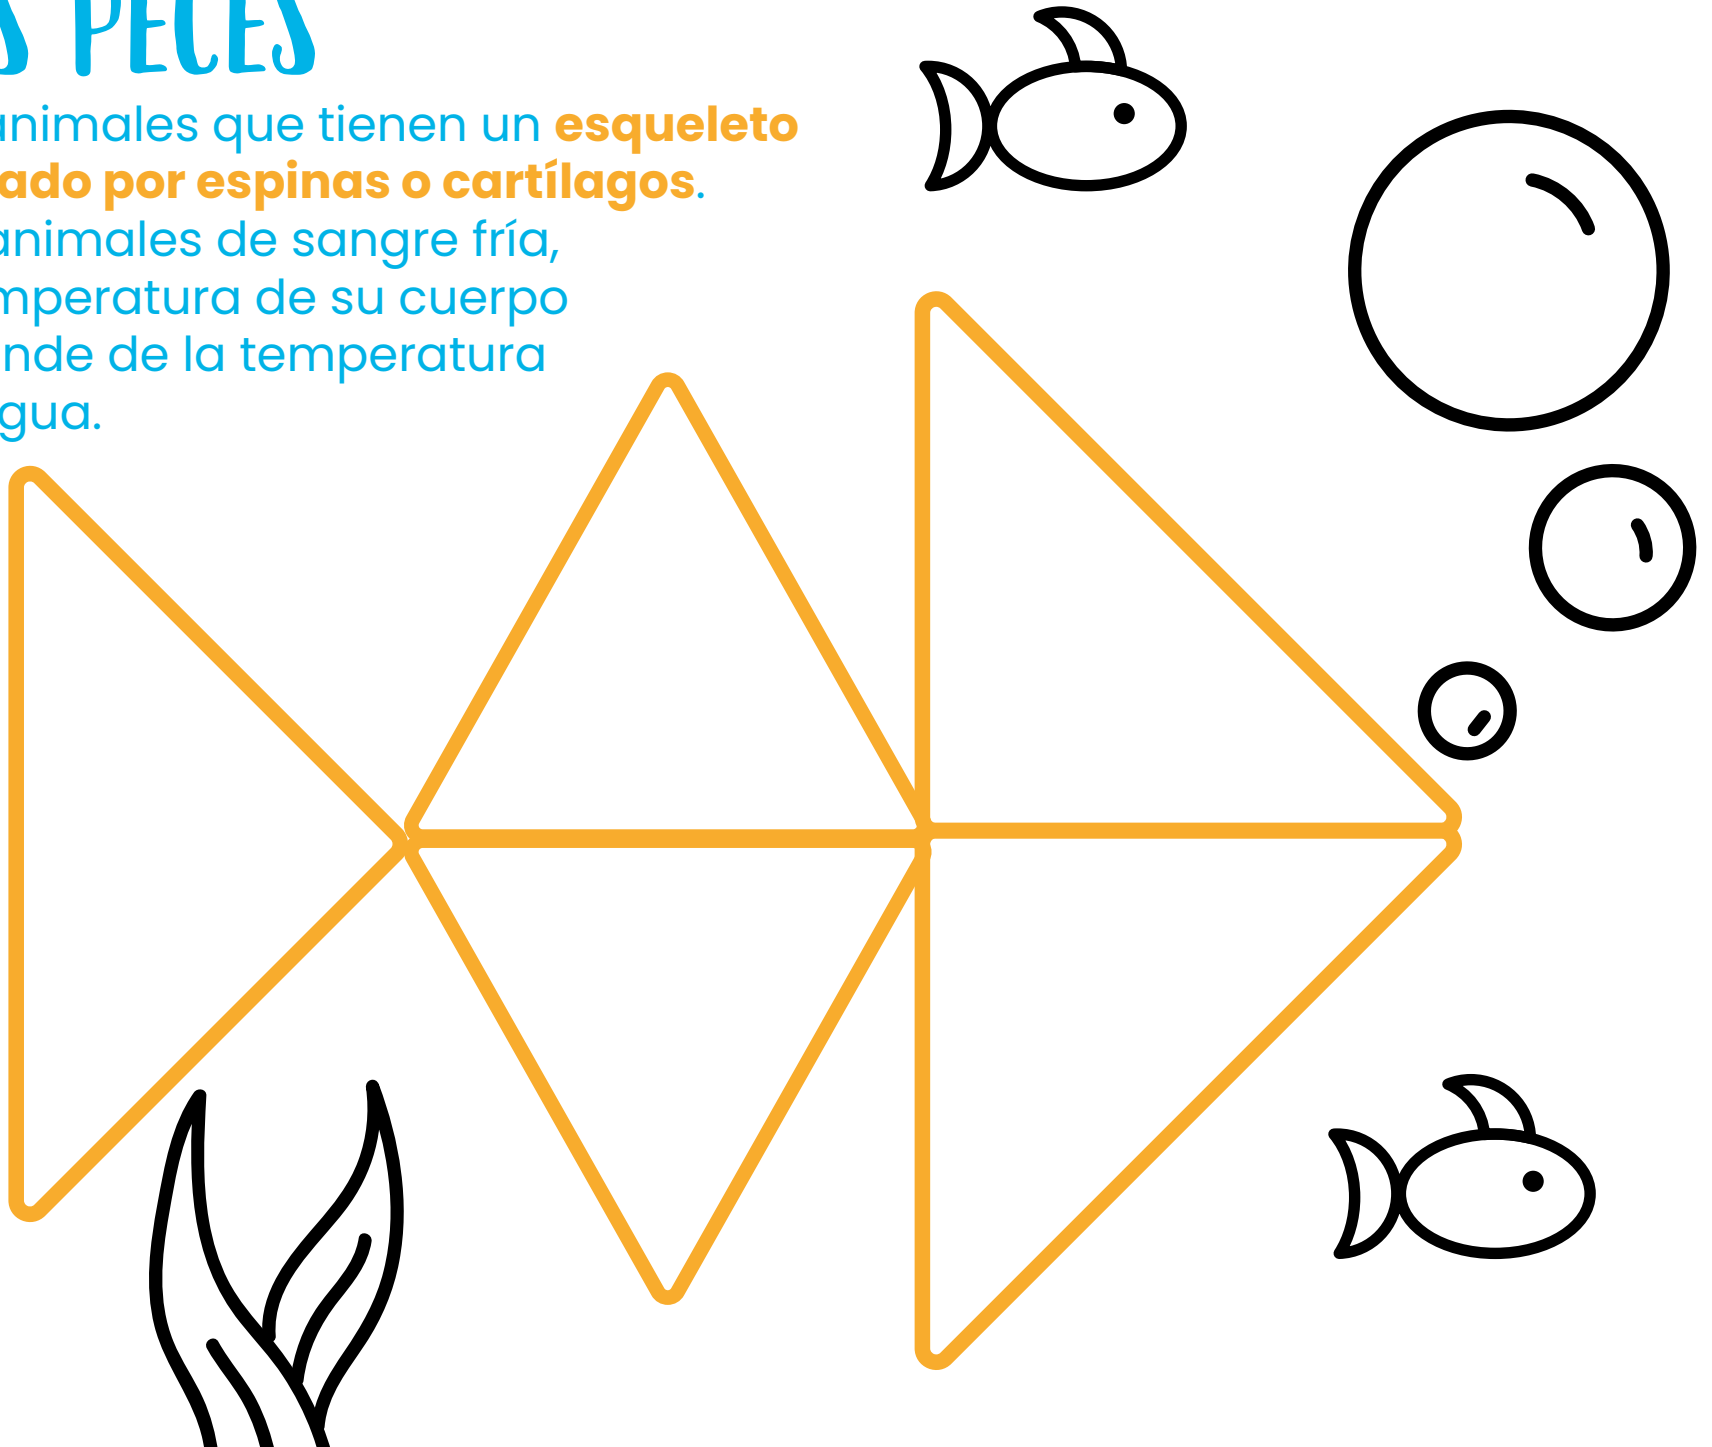

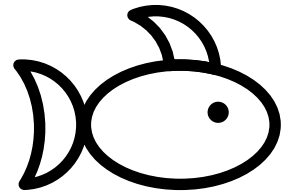

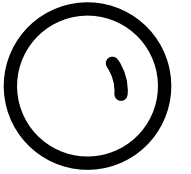

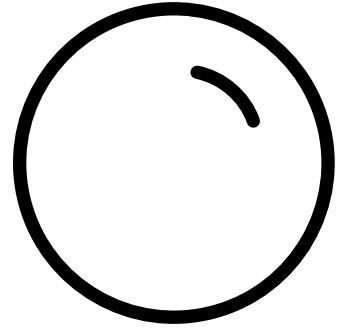

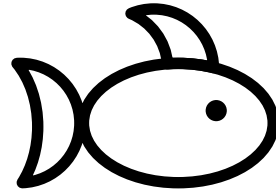

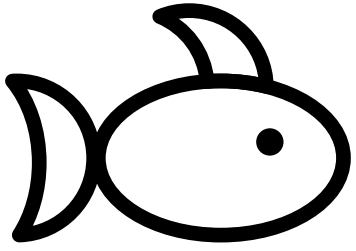

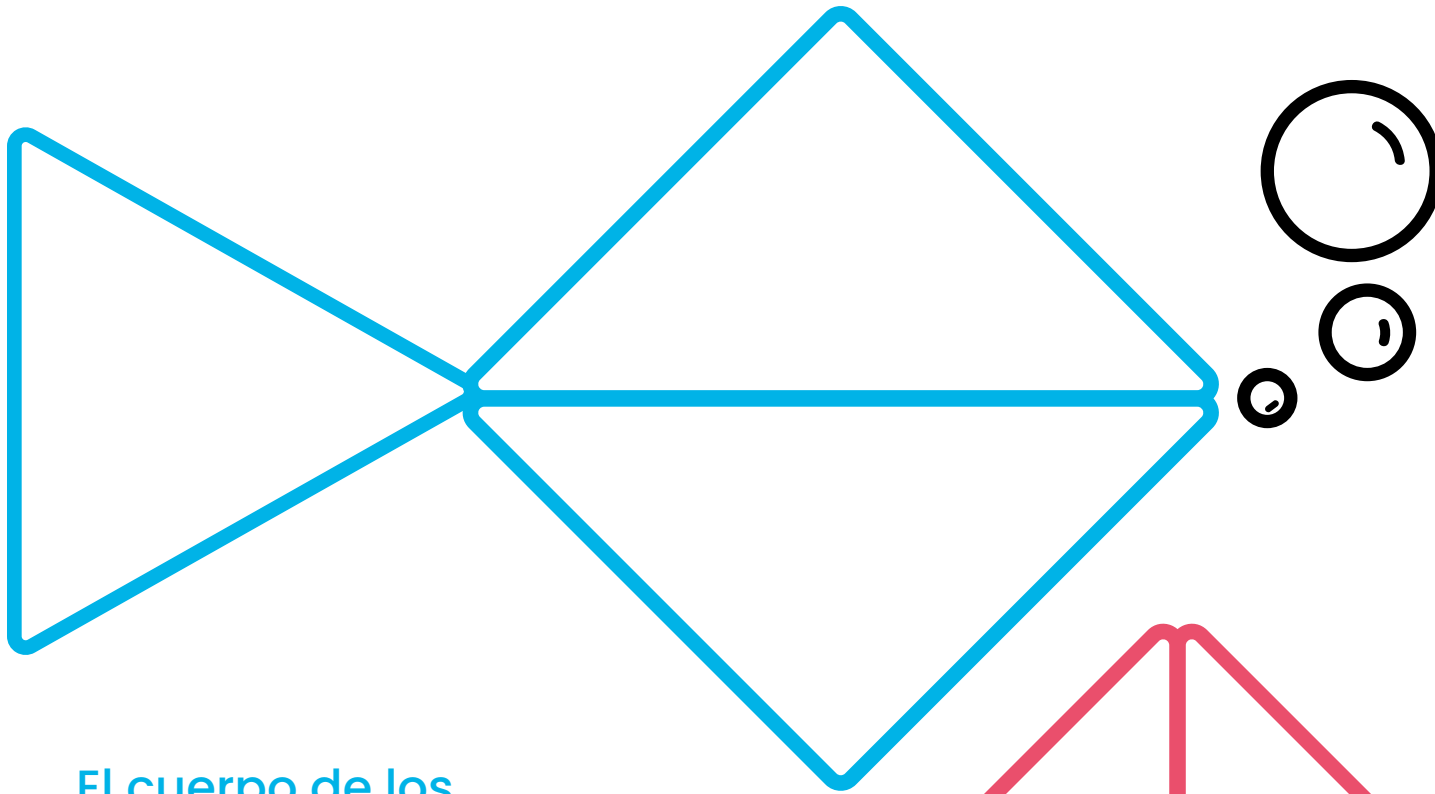

LOS PECES

son animales que tienen un **esqueleto formado por espinas o cartílagos**.

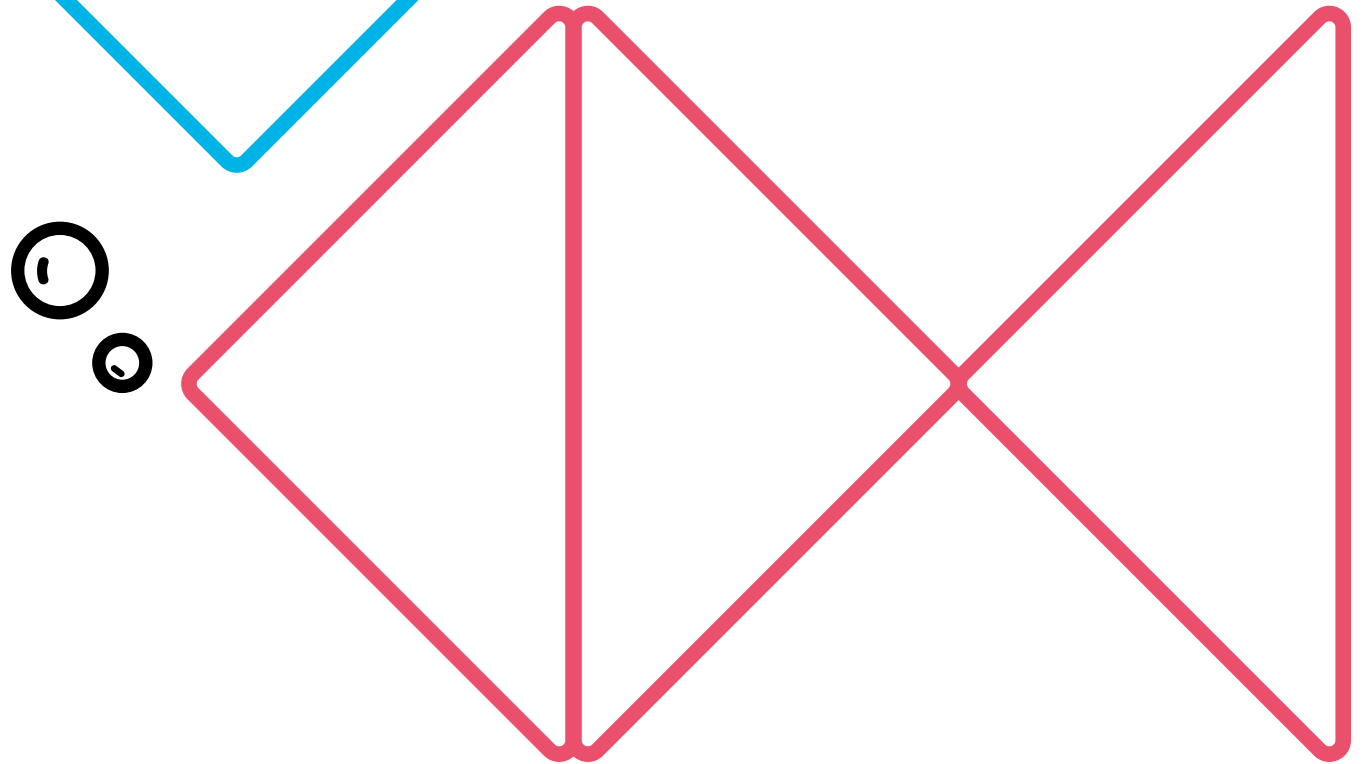

Son animales de sangre fría, la temperatura de su cuerpo depende de la temperatura del agua.

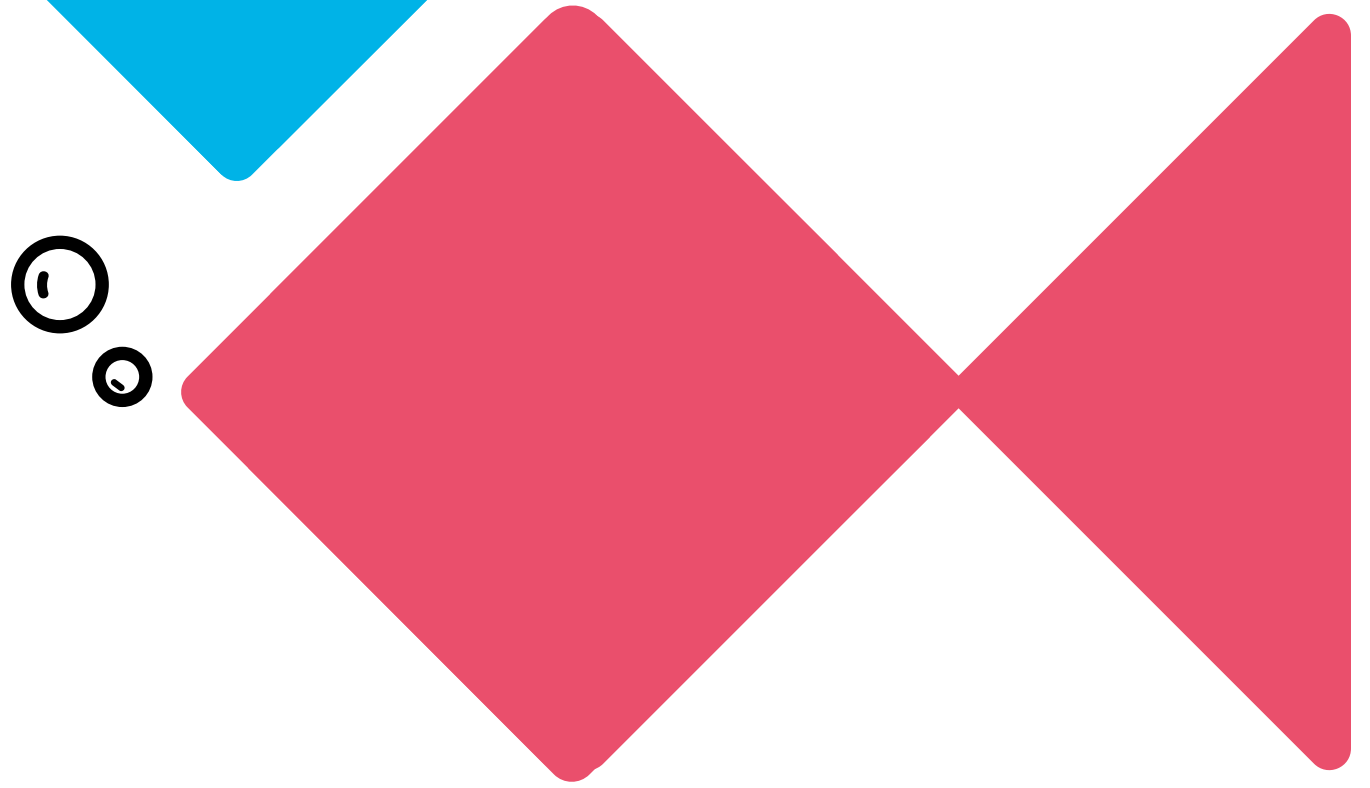

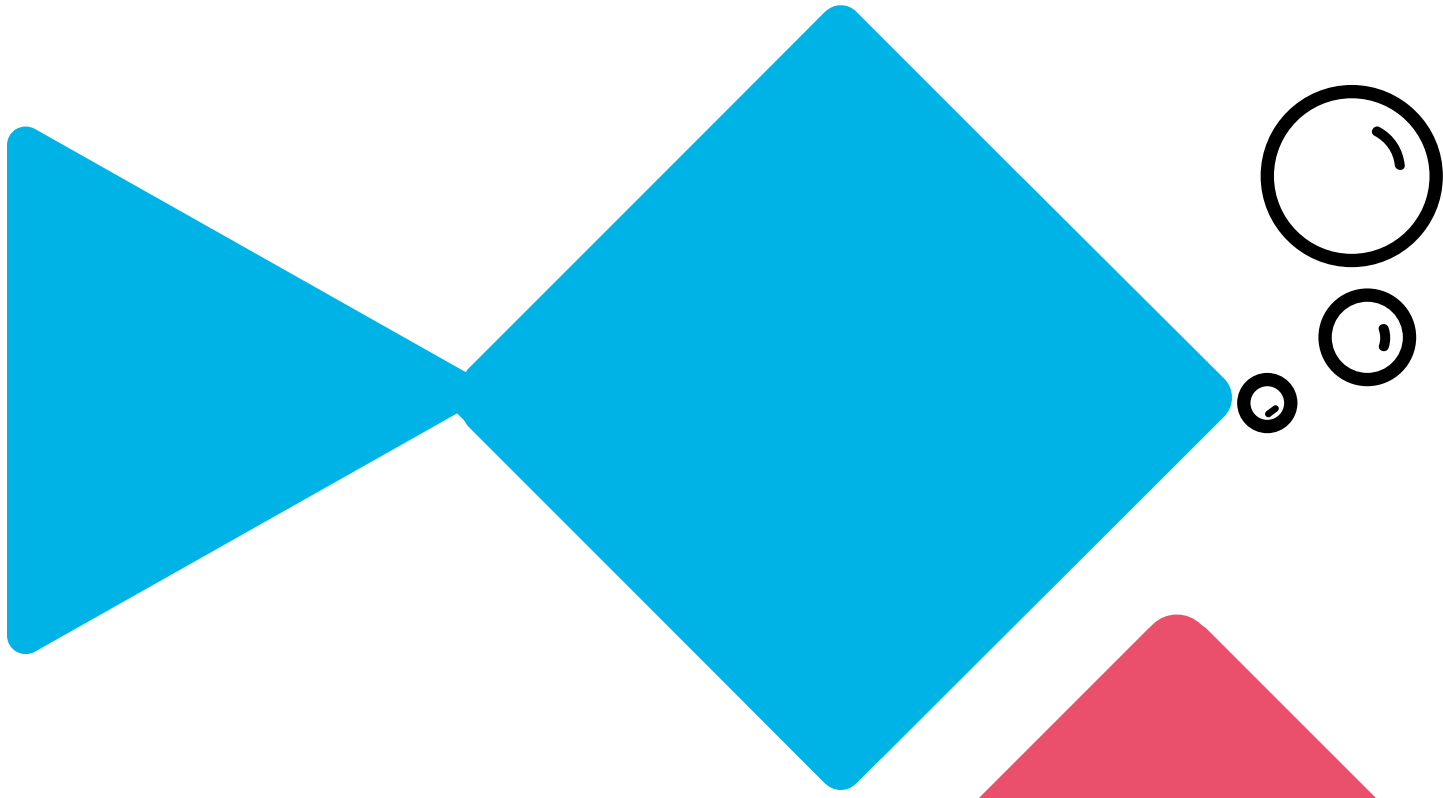

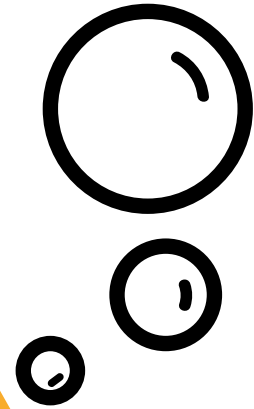

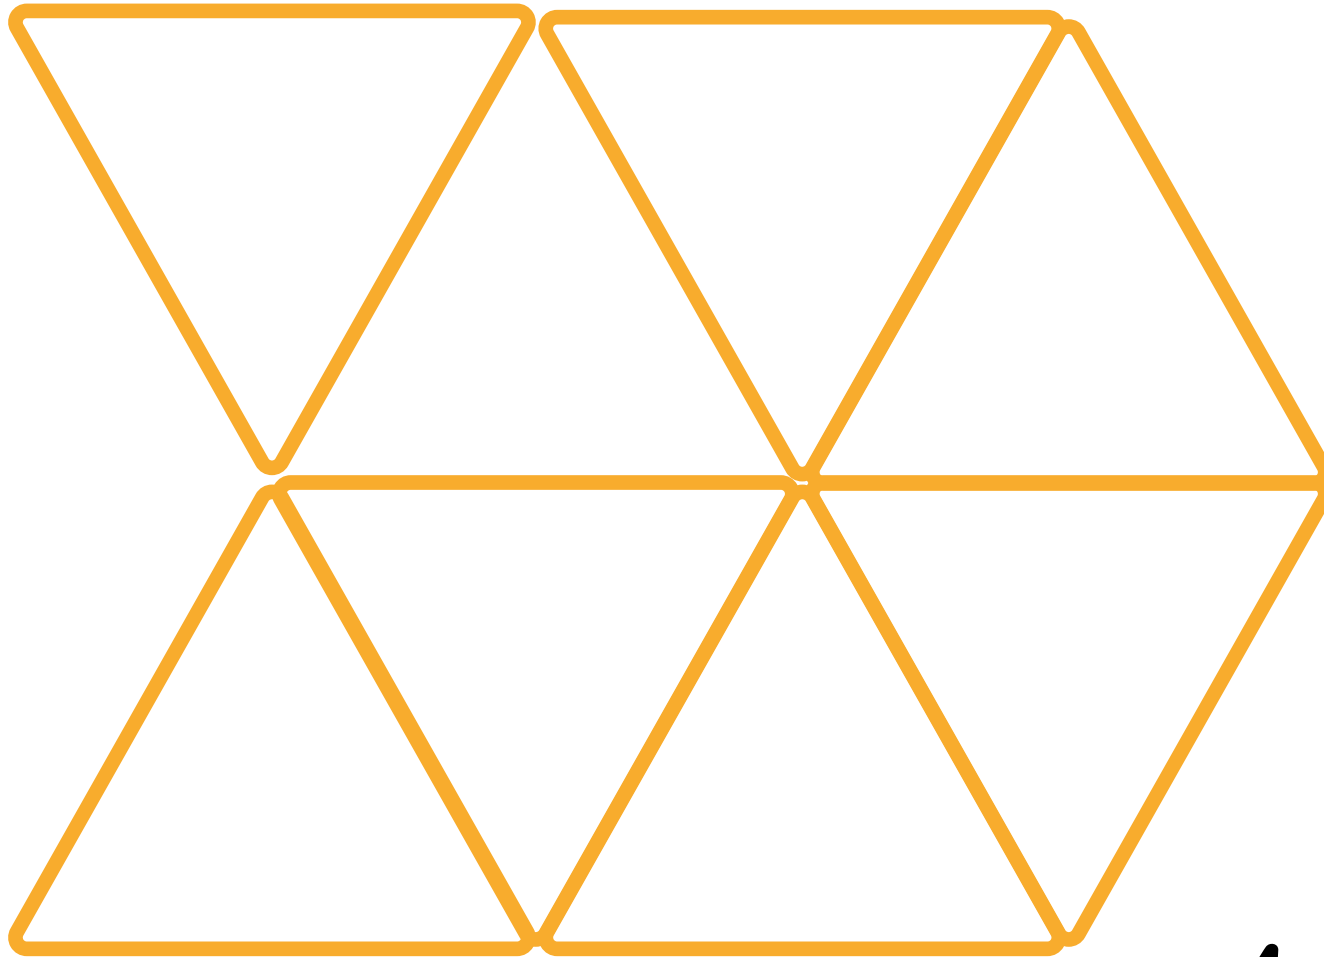

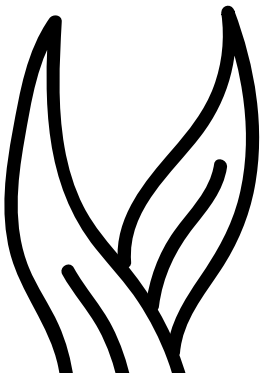

El cuerpo de los peces está **cubierto de escamas**. Tienen aletas que les permiten nadar y, gracias a sus **branquias pueden respirar** en el agua.

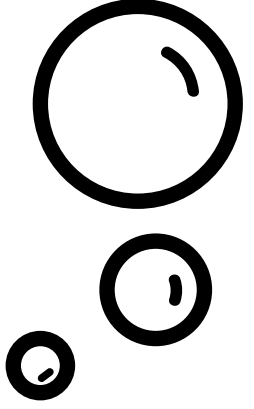

Los peces se reproducen por **huevos**,
por lo tanto son **ovíparos**.

Los faros

son torres
ubicadas cerca
de la costa.

Antiguamente,
mediante

señales de luz
avisaban a los

navegantes

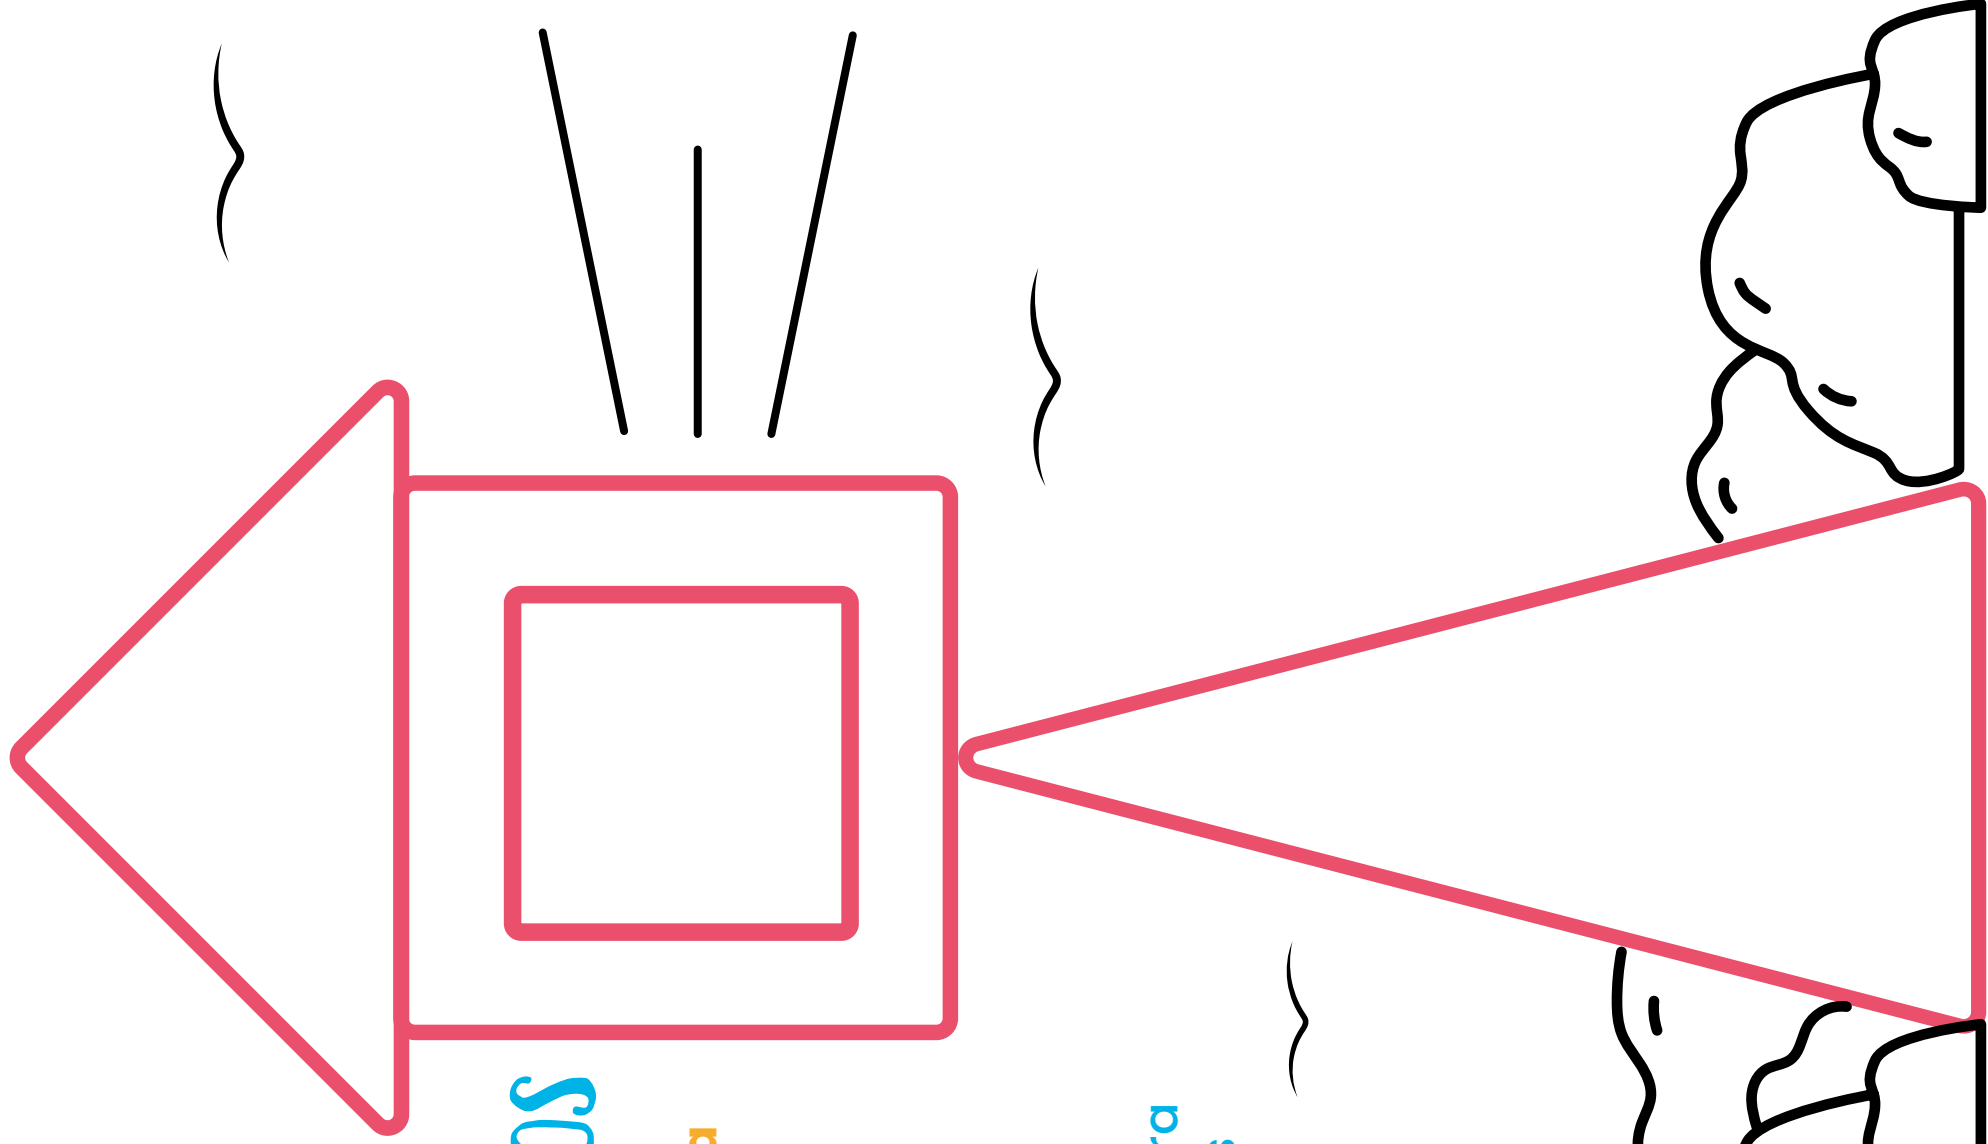

para que no

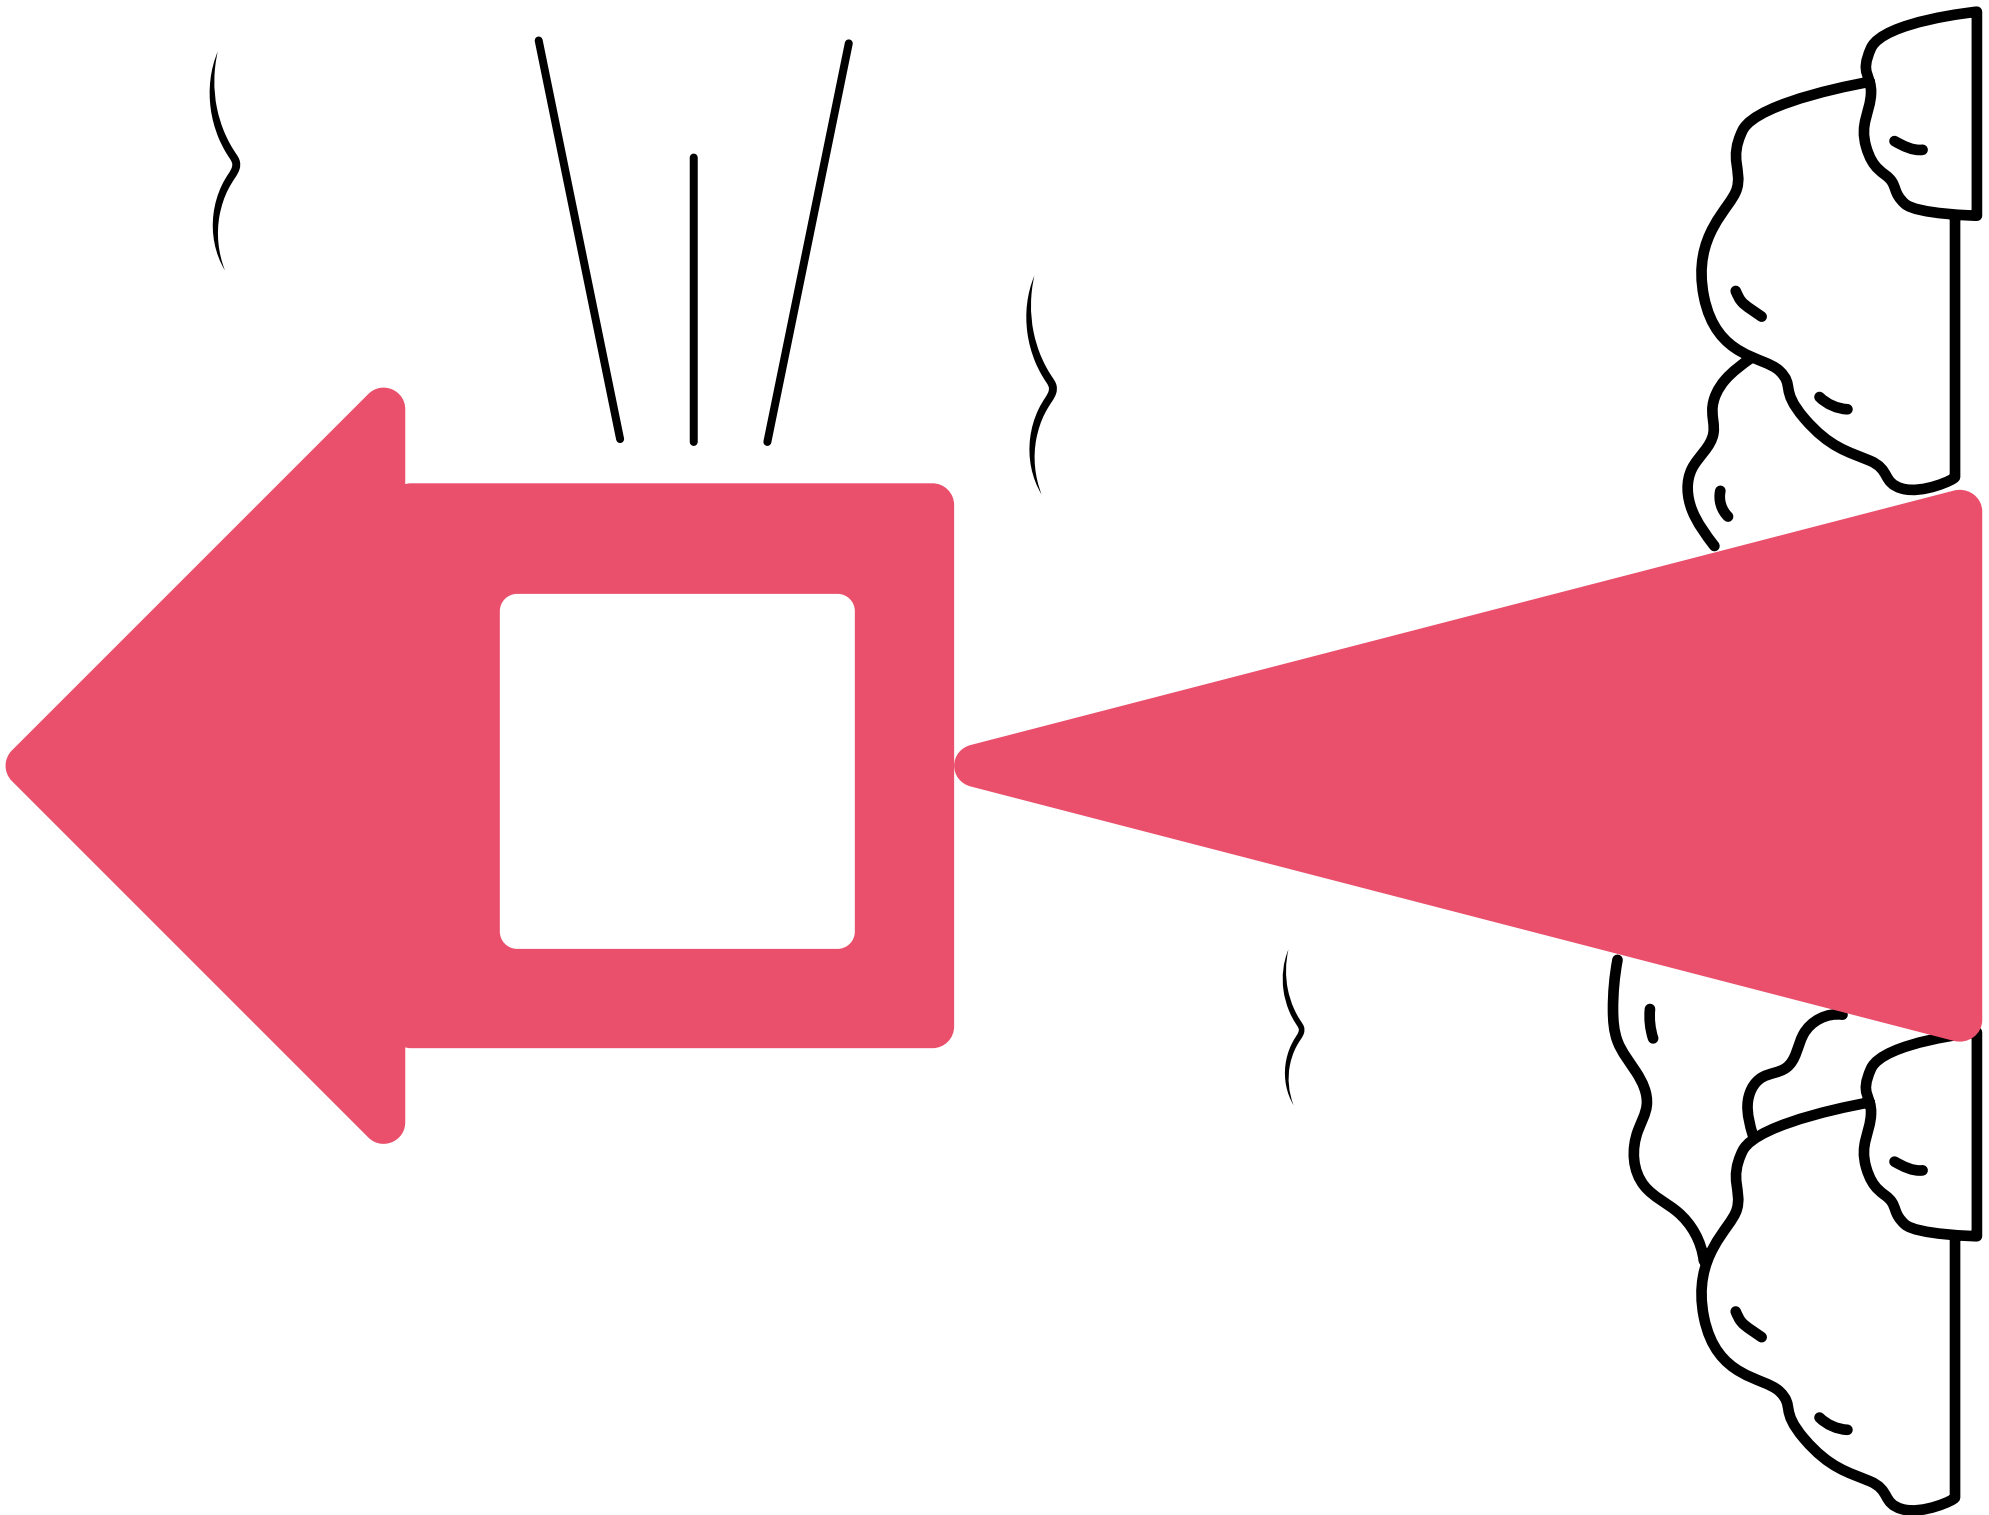

chocaran contra

los acantilados

y zonas

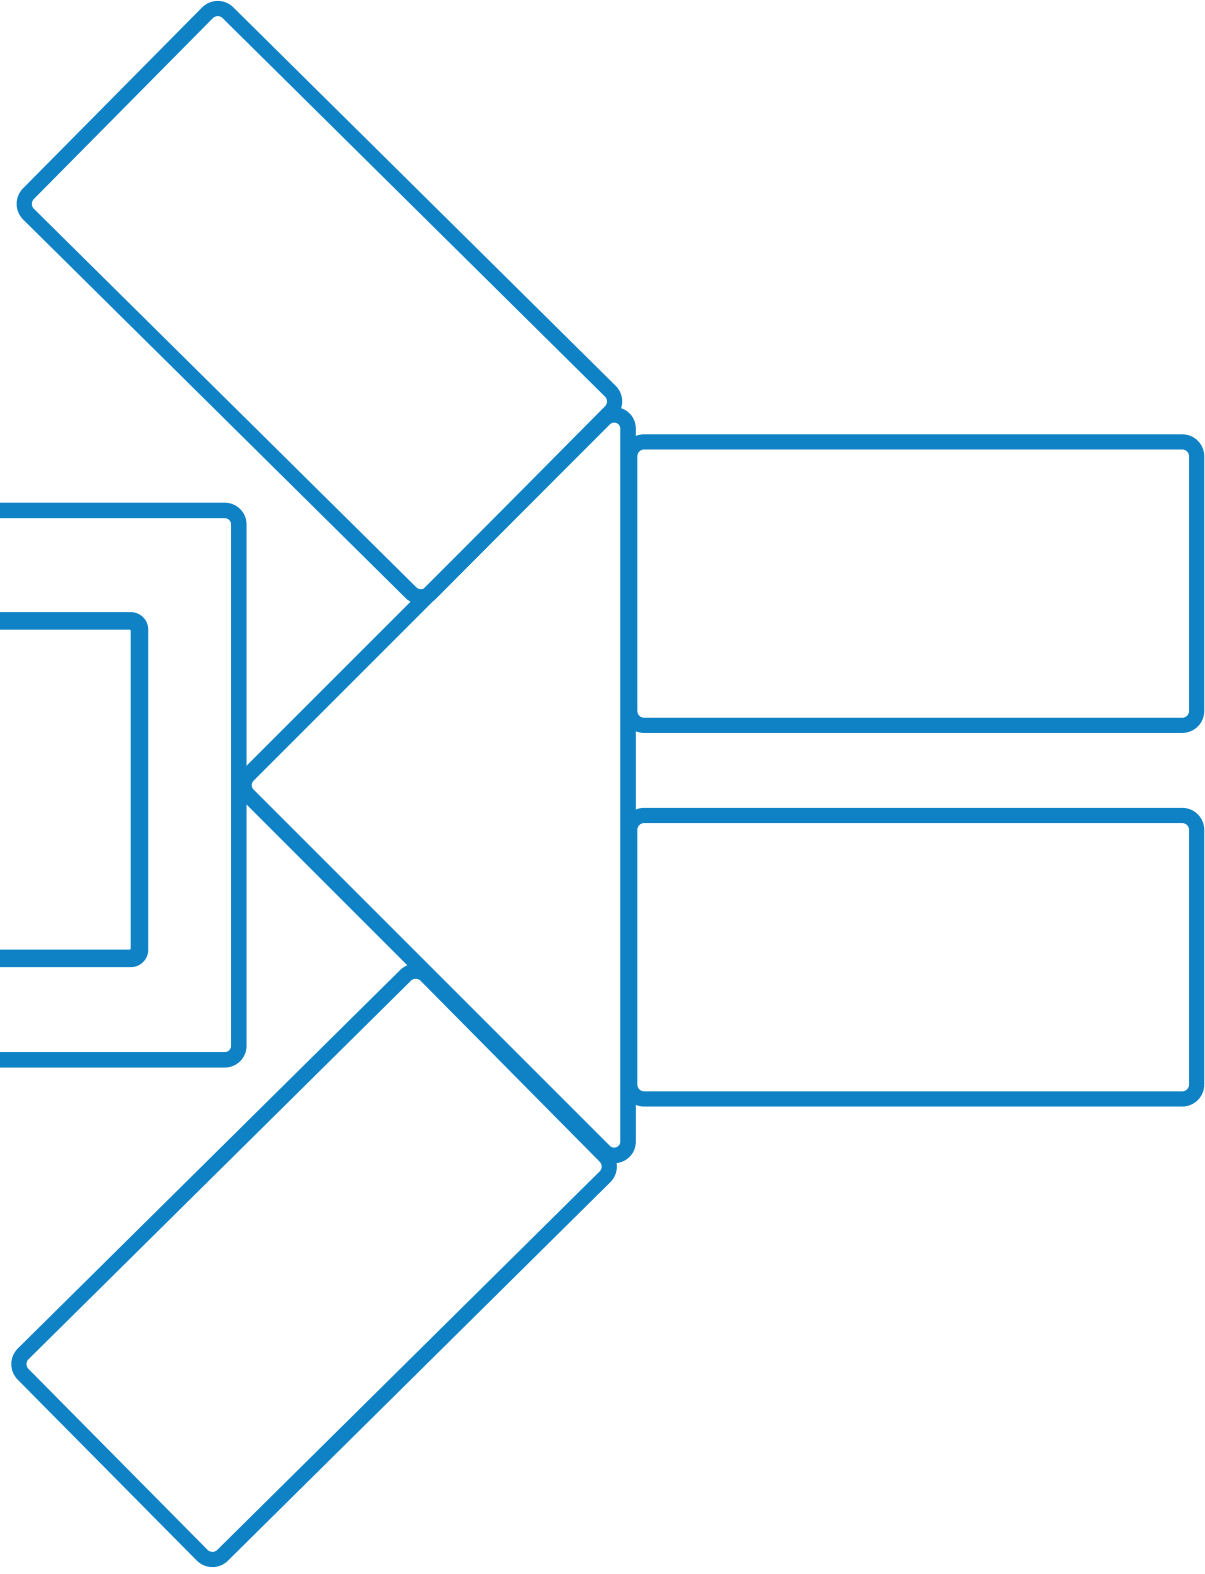

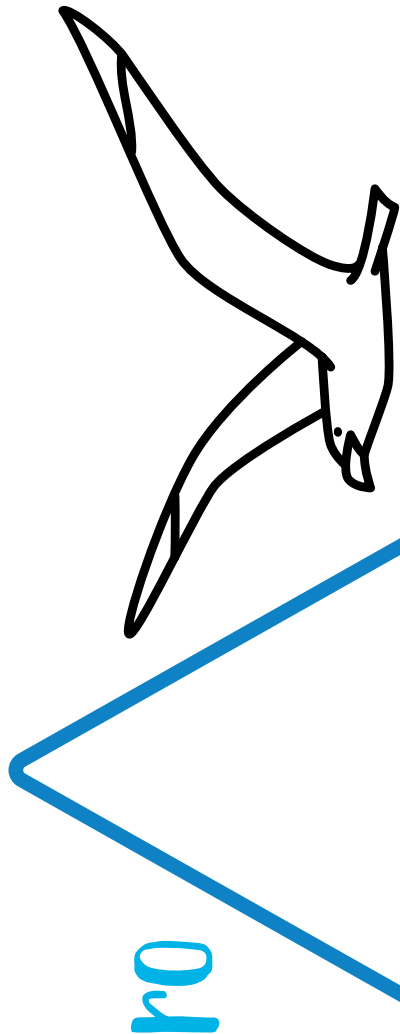

escarpadas.

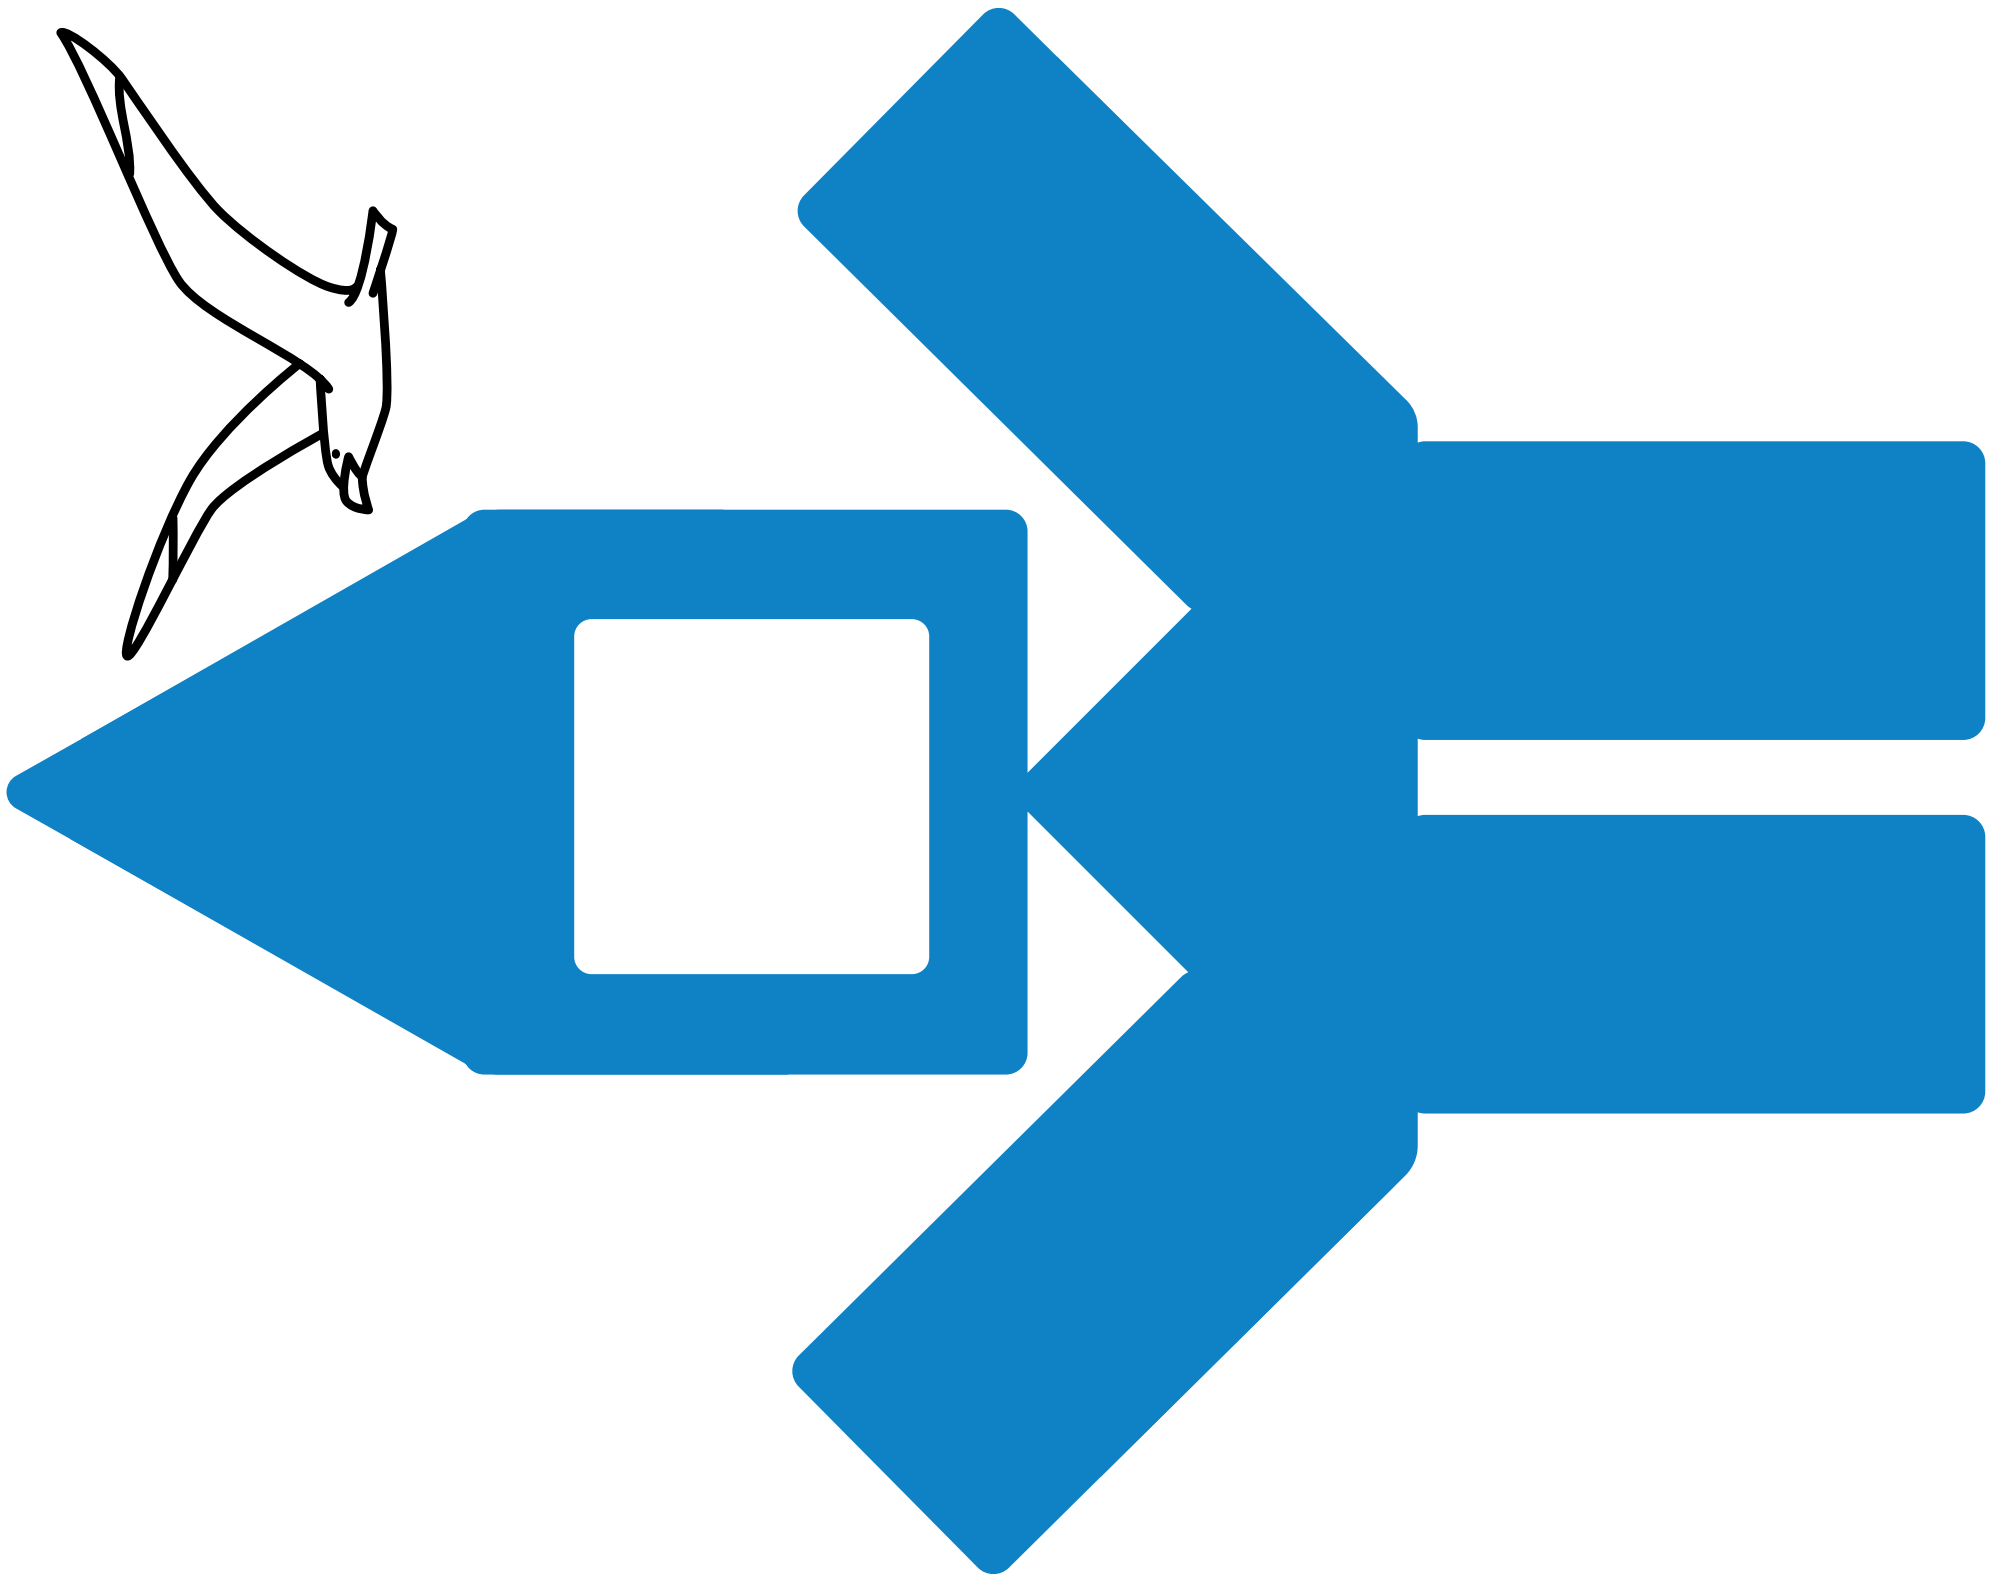

Un marinero

es una persona
que **trabaja en las**
embarcaciones
y en actividades
relacionadas a
la marina.

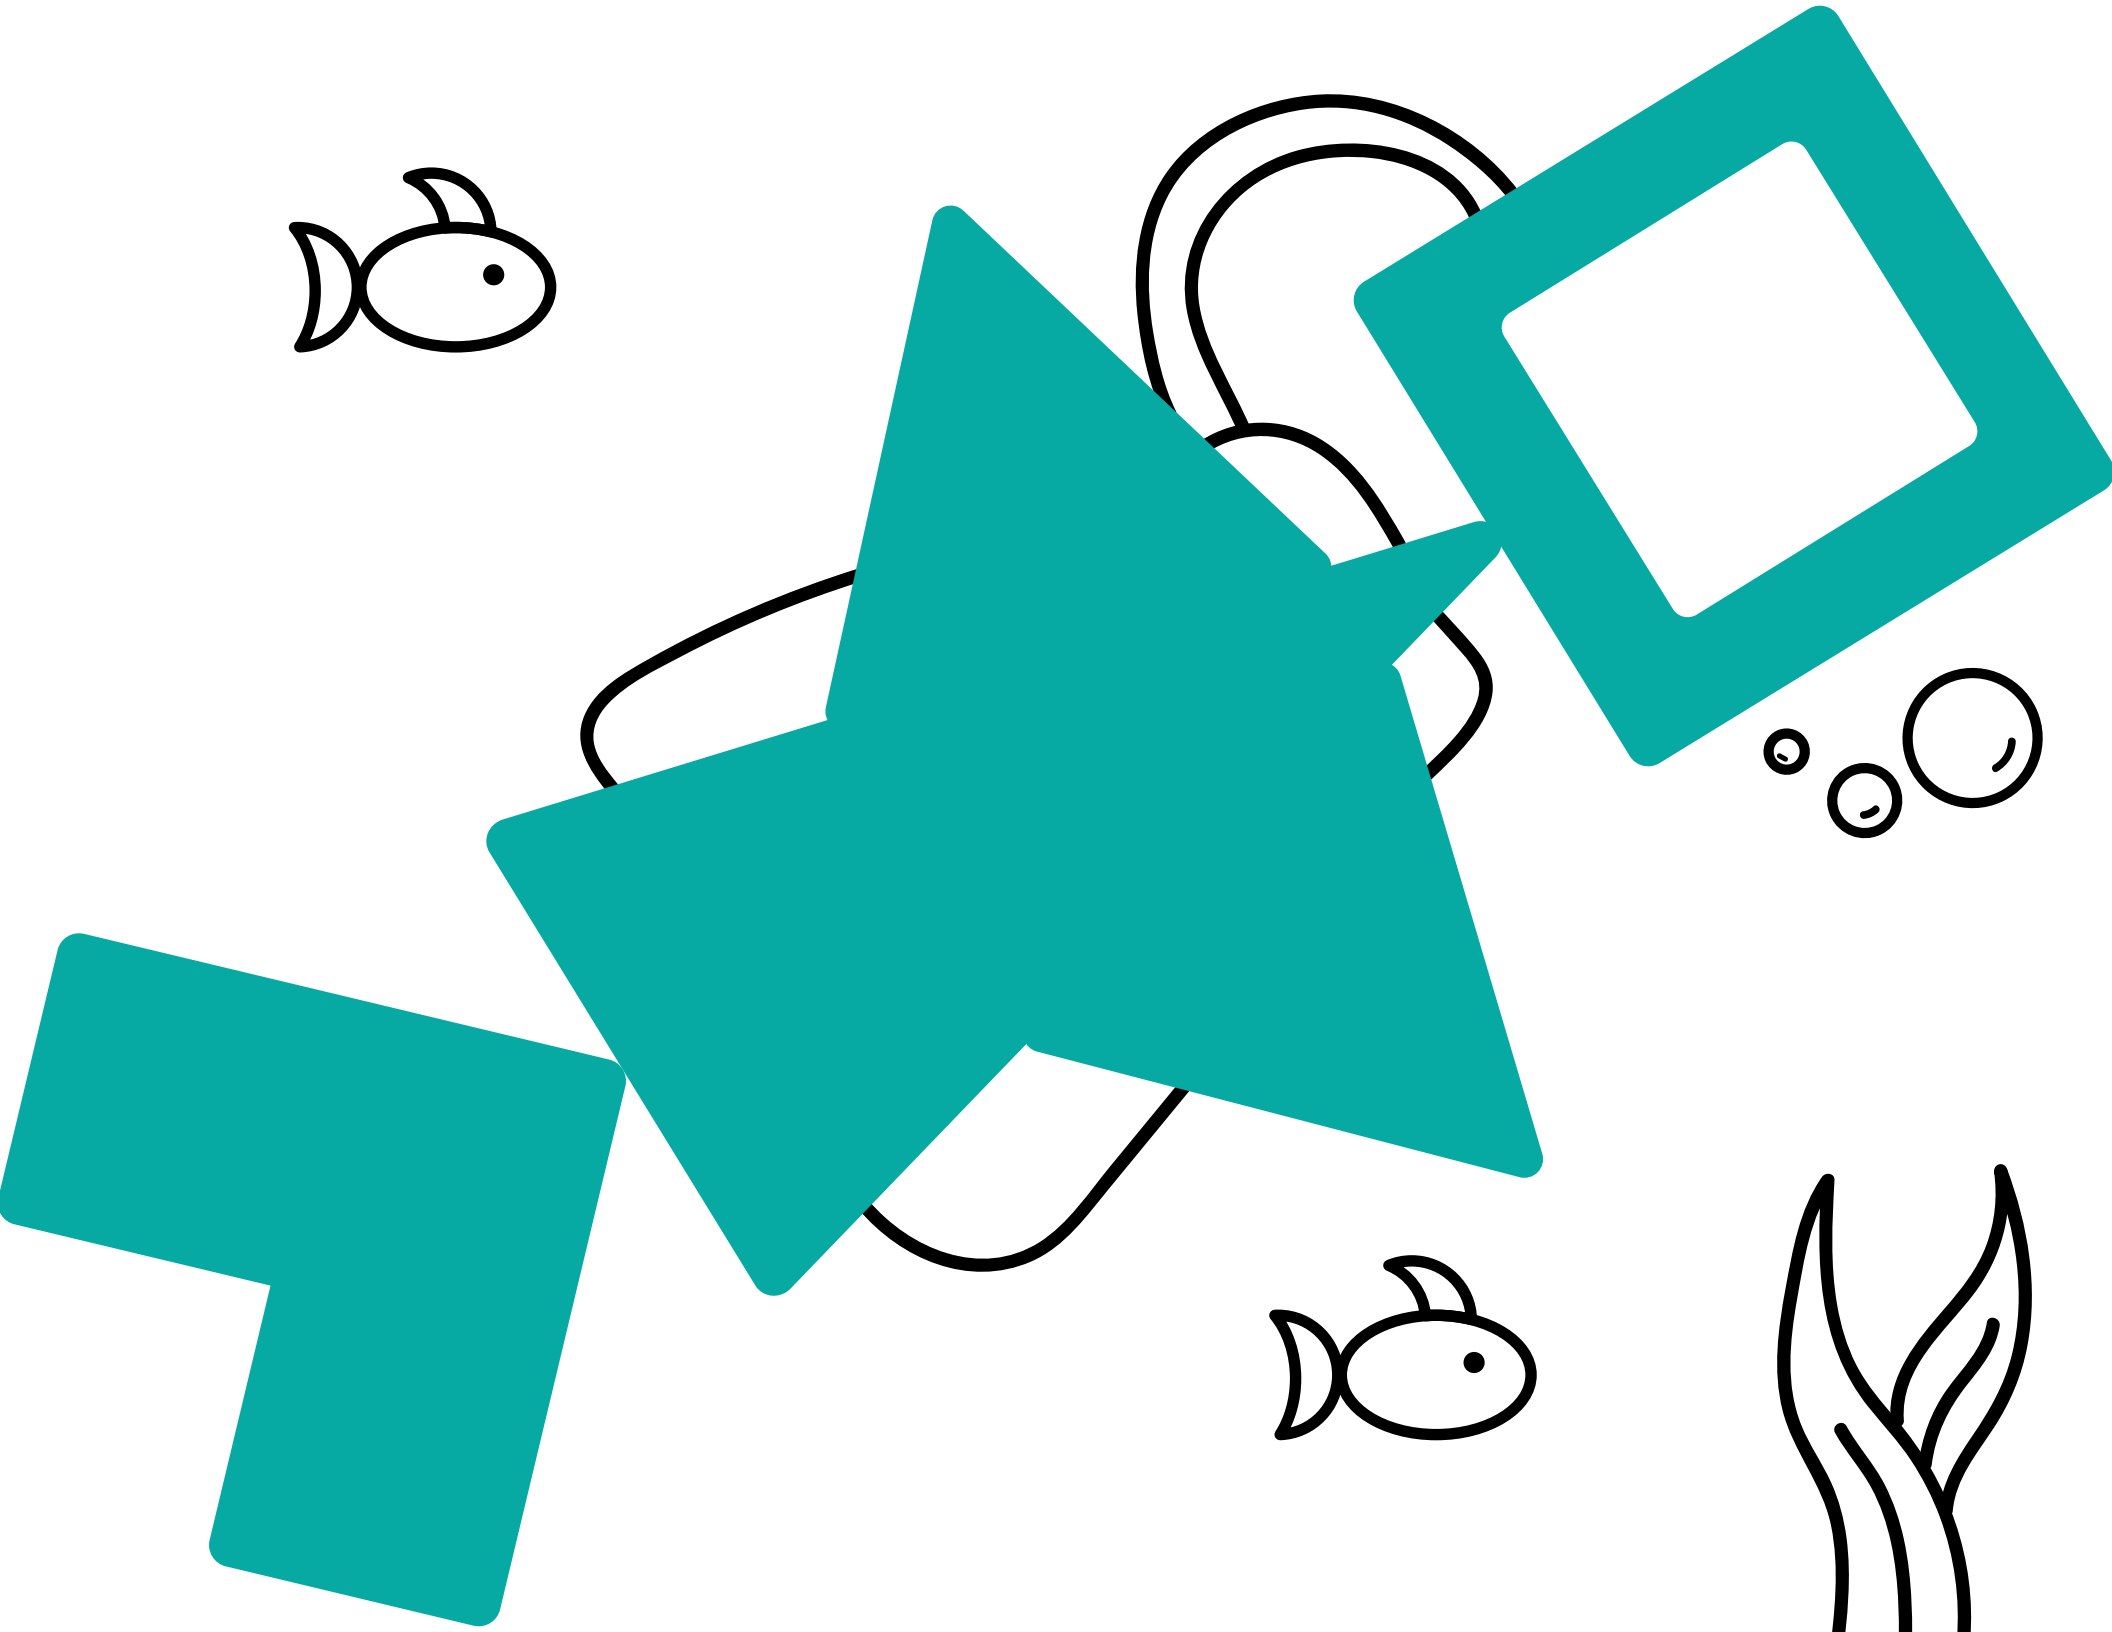

El buzo

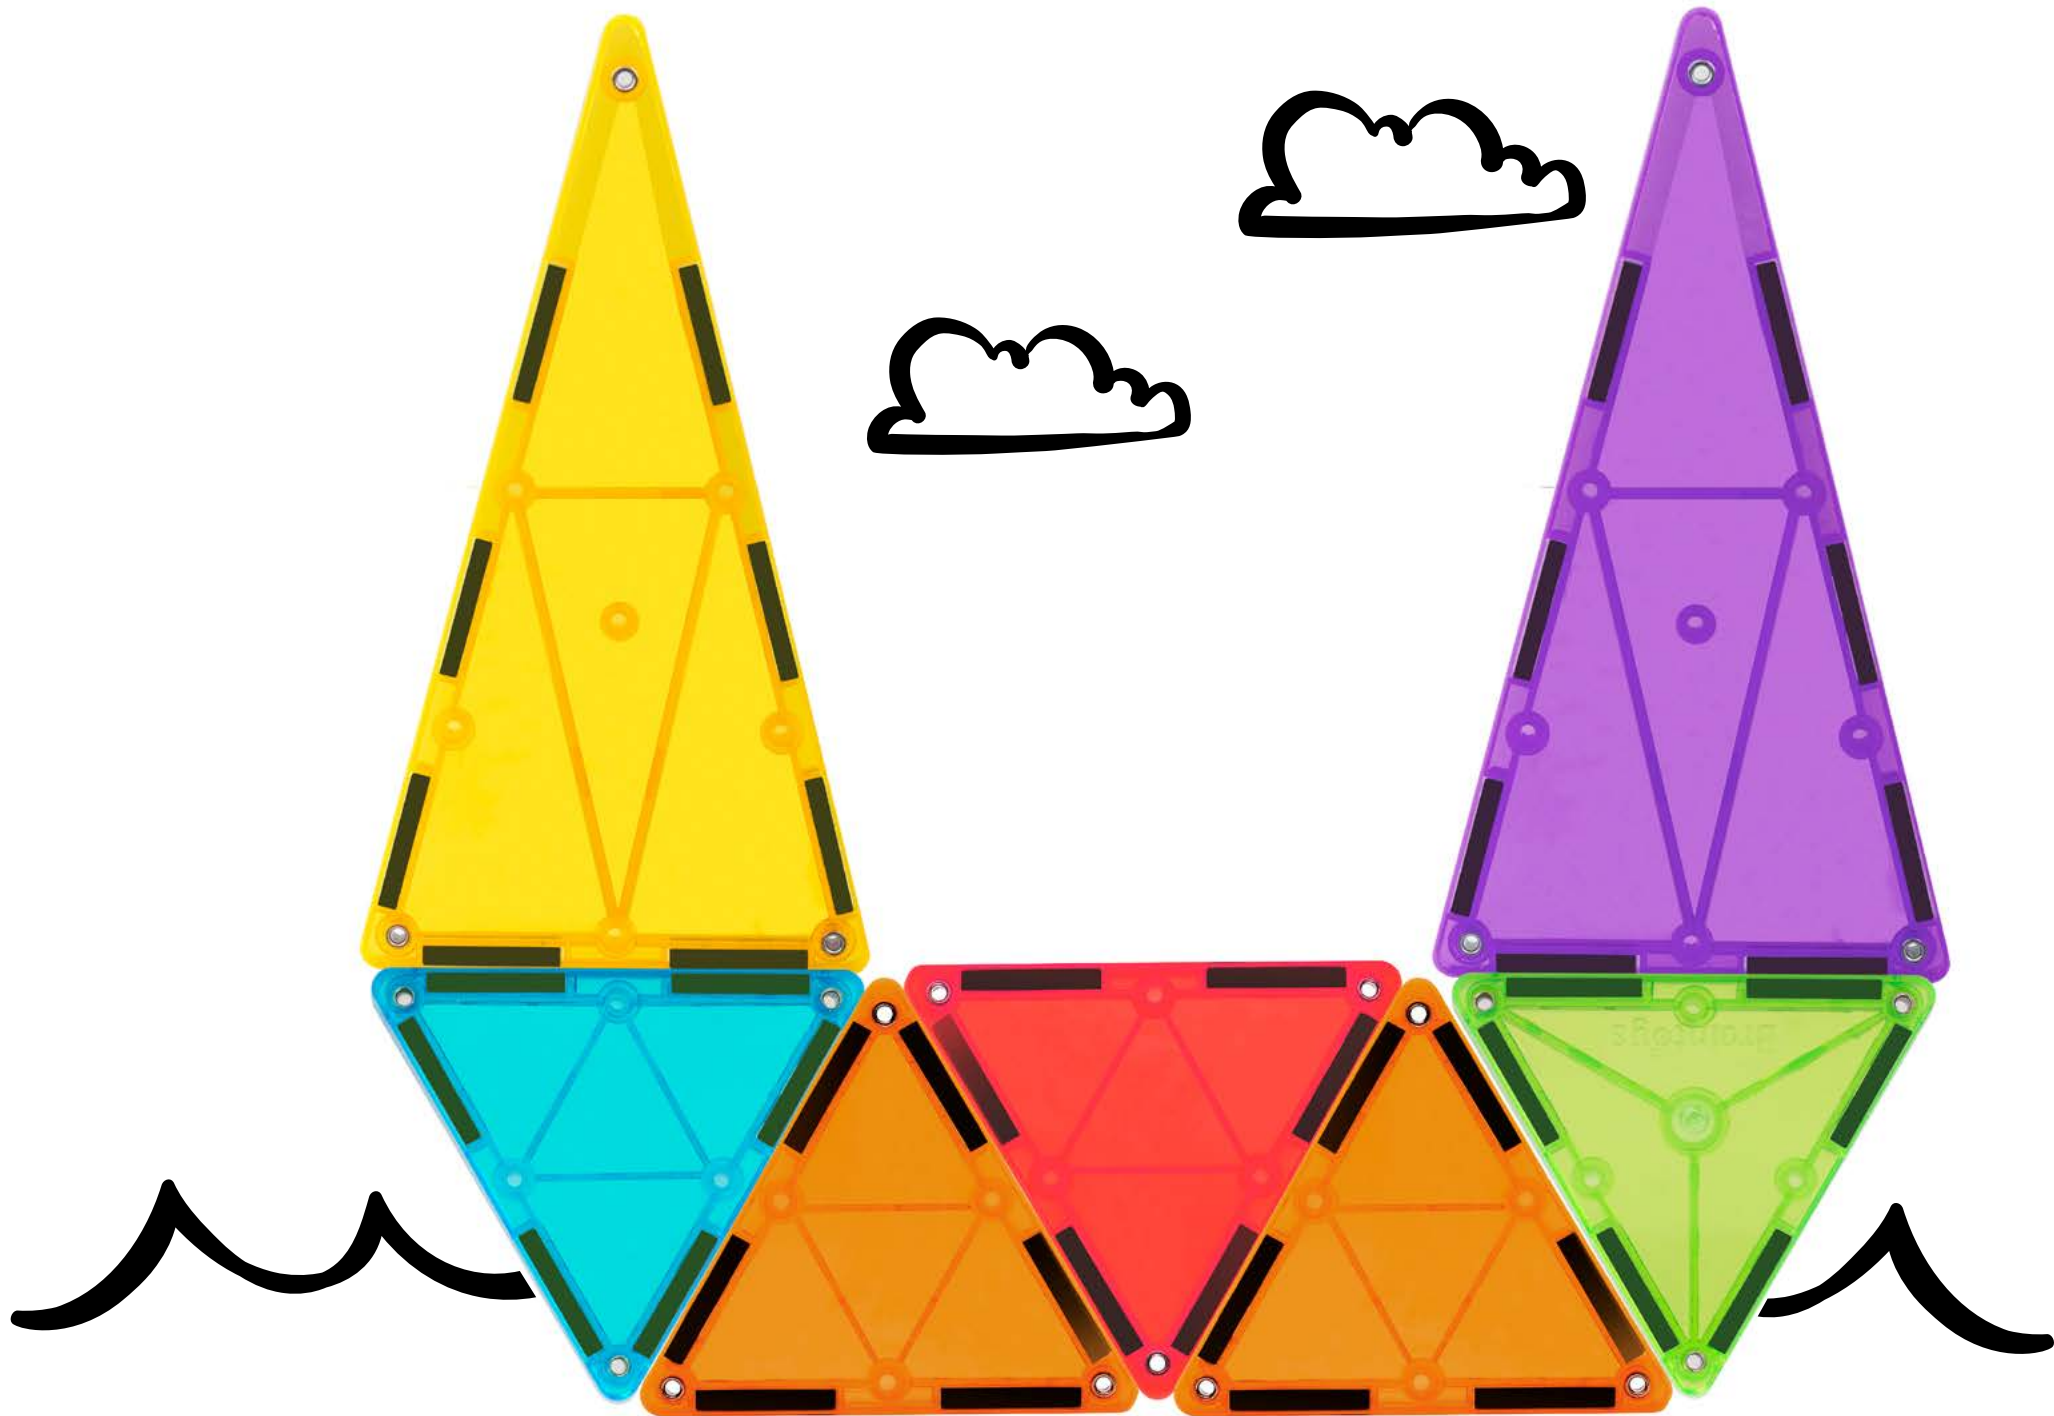

marino es una persona que tiene un equipo especial que le permite realizar diversas tareas **en las profundidades del agua.**
