

Why Use Transplanter?

- 1 It's proven to work
- 2 It's versatile and easy-to-use
- 3 It saves you money
- 4 It's good for the environment
- 5 Organic and sustainable options enhance your company's brand

Landscape Professionals Now Using Transplanter

• Landscape Contractors

Easily apply Transplanter as a Root Drench to control Transplant Shock and to reduce the high cost of replacing failed plants. An application costs less than 1% of the cost of replacing a plant.

• Landscape Architects

A Transplanter application is included in the Planting Specification - our NMS Planting Spec is available on request.

• Arborists

Use Transplanter in Vertical Mulching backfill media, apply it to mature tree roots damaged during construction or trenching, and apply it to the roots exposed by Air-Spading compacted soils.

• Tree Spade Operators

The Wettable Powder is applied to the Cutline and then watered-in after tree installation.

• Municipalities & Land Managers

A growing list of Municipalities and Conservation Authorities now specify that Transplanter be applied when all trees and shrubs are planted on their lands.

• Green Roof Contractors

Transplanter is an essential input for stabilizing the roots of plants in this high-stress environment. Applying Transplanter is highly efficacious for all* plants, in all Green Roof media (*except for Sedum, which are non-mycorrhizal plants).

• Growers

Plugs are dipped while planting. Dormant bare-roots are dipped or dusted while lining-out new stock.

What Does Transplanter Do?

Soil disturbance on landscape sites destroys or disrupts beneficial soil microbial communities. This unavoidable disturbance severely compromises the root development of newly installed plants. Planting in disturbed landscape soils frequently results in Transplant Shock – the leading cause of costly plant failures.

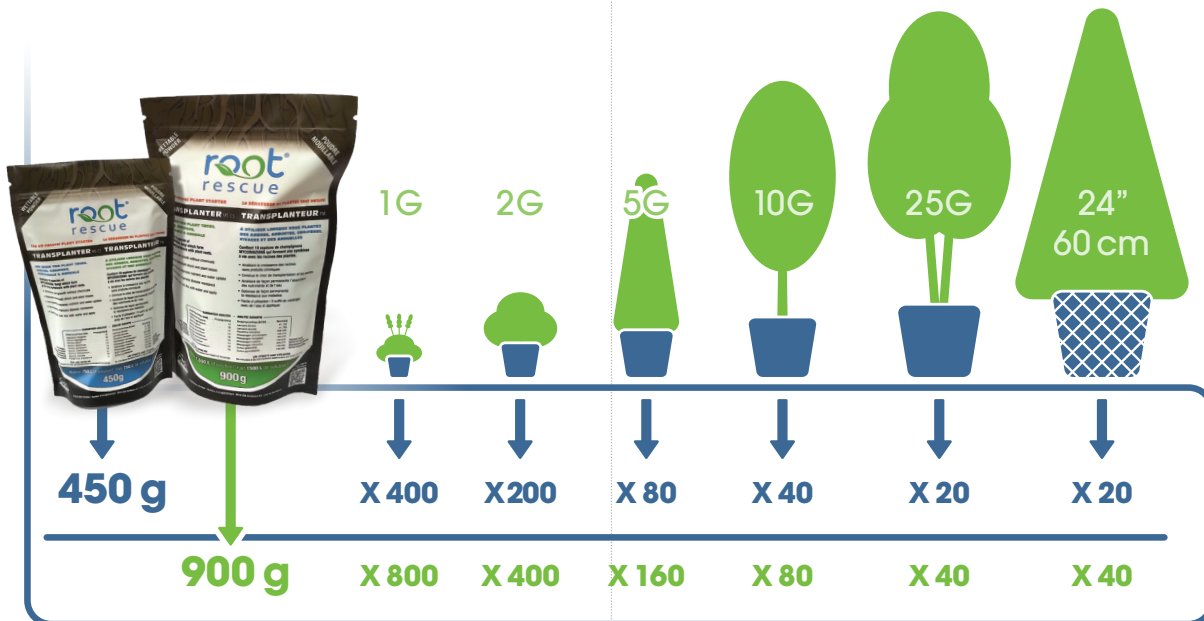

Root Rescue Transplanter Fights Transplant Shock**. The formulation delivers essential microbial support to roots in disturbed soils and planting media.

Transplanter's multi-species mycorrhizal fungi will quickly establish a beneficial

symbiosis with the roots of 95% of landscape plants, including: all Conifers, all Deciduous Trees, most Shrubs, Perennials and Annuals.

The benefits of mycorrhizal inoculation last for the life of the plant – A Tremendous Lasting Value!

** Peer-reviewed University of Guelph field trials showed that applying Transplanter is highly effective in reducing Transplant Shock. Visit rootrescue.com for complete details on the U of G research.
