

DORY

Dory is a seat designed for children from 4 to 12 years old who need postural support during recreational or teaching activities.

It is an extremely stable and robust seat with soft coloured upholstery that is pleasant to the touch. It can be combined with a large desk or a tray table fitted to the armrests to assist with the child's activities. Dory is a truly active system designed to support children with special needs while they are playing or studying.

Dory can be completed with chest support, lateral pelvis support, abductor, single platform and with wheels to facilitate movement.

Safe and comfortable!

The chair has been designed to offer the child all the necessary support to feel safe and comfortable, thereby encouraging the development of skills and promoting activity. Depending on the child's needs, the seat can be complemented with restraining supports at chest or hip level. A headrest or a backrest extension provides a larger support surface.

Other accessories allow the child to feel an active part of the class.

Important details

The chassis, adjustable for height, is covered with soft but compact padding which adapts to the child's body. It ensures a comfortable sitting position for long periods; the covering is extremely resistant to the stresses of use, such as scratching or tearing, or repeated cleaning. The armrests are adjustable for height and the chair can be supplied with a range of restraining supports: feeling safe and properly supported, the child will be encouraged to engage fully in activities.

Desk or tray table?

To facilitate the activities and use of Dory, a removable tray table can be added to the seat; the tray is shaped to offer the right support for the upper limbs, is very stable and is inserted directly on the armrests. Alternatively the child can use a desk, also shaped, adjustable in height and inclination (on request); to facilitate the movement and repositioning of the seat, Dory can be equipped with swivel wheels with brakes.

And for the posture?

Dory can also be completed with a footrest or with postural unit for the lower limbs, an abductor or a postural hip belt which, by containing the child's body, make him feel safer in carrying out activities with his classmates. The seat is designed for the attachment of all types of belts for postural support.
