Features

- **Imager**

This camera uses a 1/1.8" STARVIS™ CMOS (complementary metal-oxide semiconductor) image sensor (approx. 4.17 million effective pixels) that supports high definition to produce high-quality images.

- **ISP**

Using the image signal processor (ISP), the following images can be obtained.

- Full HD 60fps output image

The following functions are provided.

- Noise Reduction (NR)
- Wide Dynamic Range Mode (Wide-D),
Visibility Enhancer (VE), and Defog
- Super+ Image Stabilizer

With consideration given environmental protection, this module incorporates lead-free and halogen-free circuit boards.

Precautions

Software

Use of the demonstration software developed by Sony Corporation or use of the software with customer developed application software may damage hardware, the application program or the camera. Sony Corporation is not liable for any damages under these conditions.

Operation

Start the camera control software on your computer after you turn on the camera and the image is displayed.

Operation and storage locations

Do not shoot images that are extremely bright (e.g., light sources, the sun, etc.) for long periods of time. Do not use or store the camera in the following extreme conditions:

- Extremely hot or cold places (operating temperature -5°C to $+60^{\circ}\text{C}$ (23°F to 140°F))
- Close to generators of powerful electromagnetic radiation such as radio or TV transmitters
- Where it is subject to fluorescent light reflections
- Where it is subject to unstable (flickering, etc.) lighting conditions
- Where it is subject to strong vibration
- Where it is subject to radiation from laser beams

Care of the unit

Remove dust or dirt on the surface of the lens with a blower (commercially available).

Other

- Design and specifications are subject to change without notice.
- Do not apply excessive voltage. (Use only the specified voltage.) Otherwise, you may get an electric shock or a fire may occur.
- The CMOS image sensor and IC included in this camera may break if exposed to static electricity. When directly handling this camera, wear an antistatic strap, spread a conductive sheet or similar item under your workbench, and take measures to eliminate static electricity.

- In case of abnormal operation, contact your authorized Sony dealer or the store where you purchased the product.

Handling precautions

- When handling this unit, be careful not to apply an excessive load to all portions of the unit except for the sheet-metal cover. Otherwise, it may result in a failure.
- This unit is designed to be built in the housing. Therefore, take measures to prevent the unit from receiving the intense light such as sunlight directly from the direction other than the front side. Otherwise, it may cause the image quality degradation.

Phenomena specific to CMOS image sensors

The following phenomena that may appear in images are specific to CMOS image sensors. They do not indicate malfunctions.

Rolling shutter

As CMOS image sensors use shutters that capture images line-by-line, there is a slight time difference between the top and bottom of an image. As a result, images may appear skewed if the camera is moved.

White flecks

Although the CMOS image sensors are produced with high-precision technologies, fine white flecks may be generated on the screen in rare cases, caused by cosmic rays, etc.

This is related to the principle of CMOS image sensors and is not a malfunction.

The white flecks especially tend to be seen in the following cases:

- when operating at a high environmental temperature
- when you have raised the gain (sensitivity)
- when operating in Slow-Shutter mode

Aliasing

When fine patterns, stripes, or lines are shot, they may appear jagged or flicker.

Notes on incorporating a camera

When incorporating a camera on a device that turns ON/OFF 3 times or more a day on average, please confirm the temperature in the set using communication command 'CAM_TempInq' (VISCA). Please release heat until the increased temperature inside the set at the moment the set turns on reduces until it is stable at 12 °C or below.

Phenomena Specific to Lenses**Ghosting**

If a strong light source (e.g., the sun) exists near the incidence angle of the lens, bright spots may appear in the image due to diffuse reflection within the lens.

About the trademark

Basic Functions

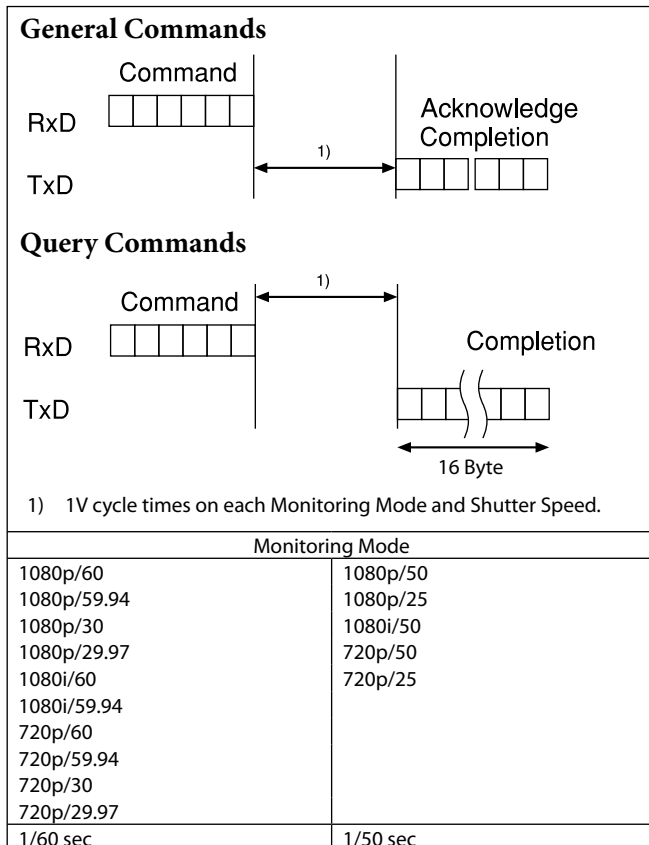

Overview of Functions

The camera control is performed by VISCA Commands.

Timing Chart

As VISCA Command processing can only be carried out one time in a Vertical cycle, it takes the maximum 1V cycle time for an Acknowledge/Completion to be returned.

If the Command/Acknowledge/Completion communication time can be less than the 1V cycle time, then every 1V cycle can receive a Command.

In general

- **Power On/Off (Standby)**

Powers the camera on and off.

When the power is off (on Standby), the camera is able to accept the VISCA Commands although the screen is set non-displayed.

- **I/F Clear**

Clears the Command buffer of the FCB camera.

- **Address Set**

VISCA is a protocol, which normally supports a daisy chain of up to seven connected cameras via RS-232C interface. In such cases, the address set command can be used to assign addresses from 1 to 7 to each of the seven cameras, allowing you to control the seven cameras with the same personal computer.

Although the FCB camera does not support direct connection of cameras in a daisy chain, be sure to use the address set command to set the address whenever a camera is connected for the first time.

- **ID Write**

Sets the camera ID.

- **Mute**

Blanks the screen and sends out a synchronizing signal.

- **Lens Initialize**

Initializes the zoom and focus of the lens. Even when power is turned on, it initializes the zoom and the focus.

Video Output

This camera can output two types of videos, FHD output / HD output.

• FHD output / HD output

This can video output the Monitoring Mode as shown in the table below. The video interface is the LVDS (Low Voltage Differential Signaling).

Monitoring Mode	
1080p/60	1080p/50
1080p/59.94	1080p/25
1080p/30	1080i/50
1080p/29.97	720p/50
1080i/60	720p/25
1080i/59.94	
720p/60	
720p/59.94	
720p/30	
720p/29.97	
1/60 sec	1/50 sec

Zoom

The zoom function contains 2 functions, enhanced optical zoom and digital zoom.

• Enhanced optical zoom

Zoom function that enlarges the image by moving the zoom lens while changing the effective pixel area of the image sensor.

This can zoom up to 30 \times .

• Digital zoom

The function to zoom images digitally by cropping the center part of captured images to zoom with the CMOS image sensor.

When the zoom diameter goes up, the resolution will go down. This can zoom up to 12 \times .

When StableZoom is used, the unit can zoom up to 432 \times .

Zoom has the following modes.

Using Standard Mode

Using Variable Mode

There are eight levels of zoom speed.

Notes

- The zoom will be stopped when a Stop Command is sent after the zoom operation is started in Standard Mode or Variable mode. If you do not send a Stop Command, the zoom will be stopped after reaching the Wide end or the Tele end.
- The StableZoom and Zoom Separate mode do not work at the same time. When one function is ON, the other function cannot be turned ON.

Direct Mode

Setting the zoom position enables quick movement to the designated position.

Digital Zoom

The Zoom Mode supports, a OFF, a Combined Mode and a Separate Mode.

Combined Mode

This is the previously existing zoom method. After the enhanced optical zoom has reached its maximum level, the camera switches to Digital Zoom Mode.

Separate Mode

In this mode, Enhanced Optical Zoom and Digital Zoom can be operated separately. You can use digital zoom magnification at any time from within any level of optical magnification.

Note

When you operate Direct Mode Digital Zoom
When the Digital Zoom is operated in the Direct Mode, the Direct Zoom Position of the Inquiry Command is not immediately reflected. Place a wait time before reading the position.
When using the Slow Shutter, place a wait time more than twice the shutter speed.
When not using Slow Shutter, place a wait time of 0.1 seconds or more.

About Continuous Zoom Position Reply

With ZoomDirect mode, or when zooming according to a preset, the camera outputs zoom position data when Continuous Zoom Position Reply is set to On via a command.

Continuous Zoom Position Reply: y0 07 04 69 0p 0p 0q 0q 0q 0q FF

pp: D-Zoom Position

qqqq: Zoom Position

Focus

Focus has the following modes.

• Auto Focus Mode

The Auto Focus (AF) function automatically adjusts the focus position to maximise the high frequency content of the picture in a center measurement area, taking into consideration the high luminance and strong contrast components. The minimum focus distance is 100 mm at the Wide end and 1200 mm at the Tele end.

- Normal AF Mode

This is the normal mode for AF operations.

- Interval AF Mode

The mode used for AF movements carried out at particular intervals. The time intervals for AF movements and for the timing of the stops can be set in one-second increments using the Set Time Command. The initial setting for both is set to 5 seconds.

- Zoom Trigger Mode

When zoom position is changed, it becomes AF mode during the pre-set value (initial setting is set to 5 seconds). Then it stops.

• AF Sensitivity

The switching of AF sensitivity can be set.

- Normal

Reaches the highest focus speed quickly. Use this when shooting a subject that moves frequently. Usually, this is the most appropriate mode.

- Low

Improves the stability of the focus. When the lighting level is low, the AF function does not take effect, even though the brightness varies, contributing to a stable image.

• Manual Focus Mode

Manual Focus has both a Standard Mode and a Variable Mode. Standard Mode focuses at a fixed rate of speed. Variable Mode has eight speed levels.

Note

In these standard and variable modes, it is necessary to send Stop Command to stop the zoom operation.

• One push AF

When sending a One Push Trigger command in Manual Focus Mode, the lens moves to focus on the subject. After that, it will convert to the normal Manual Focus Mode.

There are two kinds of One Push Trigger commands.

- One Push Trigger

As with the Auto Focus, move the focus smoothly and focus on the subject.

- Full Scan One Push Trigger

Perform a Full Scan (move the focus to the whole area from the Near end to the Far end), and focus on the subject after confirming the distance with the subject.

Unlike the One Push Trigger, the time to focus is longer because of full scan operation, but you can focus more accurately.

• Near Limit

Can be set in a range from 1000 (∞) to F000 (100 mm). Initial setting: D000h (33 cm)

• Spot Focus

Spot Focus allows you to focus on a specific area.

You can use Spot Focus when it is difficult to focus on the subject using normal AF mode.

The focus range of 6 blocks vertically and 8 blocks horizontally can be designated.

When specifying this part, specify it at the starting point (1,1) and the terminating point (3,2) or at the starting point (1,2) and the terminating point (3,1). Be sure to specify at the diagonal position.

Spot Light Avoidance

When shooting a subject with a spot light source such as an outdoor light, the camera may not be in focus due to AF / One push AF.

For example, when shooting outdoors at night with a surveillance camera, this symptom is likely to occur. In that situation, using the Spot Light Avoidance function, you can focus with the AF / One push AF.

• Example of subject that can be focused by the Spot Light Avoidance

Spot Light Avoidance OFF

Spot Light Avoidance ON

Note

Depending on the zoom ratio and the brightness of the spotlight, this function may not be effective.

White Balance (WB)

White Balance has the following modes.

- **Auto**

This mode computes the white balance value output using color information from the entire screen. It outputs the proper value using the color temperature radiating from a black subject based on a range of values from 2500K to 7500K.

This mode is the initial setting.

- **ATW**

Auto Tracing White balance (2000K to 10000K)

- **Indoor**

3200K Base Mode

- **Outdoor**

5800K Base Mode

- **One Push WB**

The One Push White Balance mode is a fixed white balance mode that may be automatically readjusted only at the request of the user (One Push Trigger), assuming that a white subject, in correct lighting conditions, and occupying more than 1/2 of the image, is submitted to the camera.

One Push White Balance data is lost when the power is turned off. If the power is turned off, reset One Push White Balance.

- **Manual WB**

This is a mode that enables you to manually set the control of R and B gain up to 256 steps.

- **Outdoor Auto**

This is an auto white balance mode specifically for outdoors. It allows you to capture images with natural white balance in the morning and evening.

- **Sodium Vapor Lamp Auto**

This is an auto white balance mode that is compatible with sodium vapor lamps.

- **Sodium Vapor Lamp**

This is a fixed white balance mode specifically for sodium vapor lamps.

- **Sodium Vapor Lamp Outdoor Auto**

This is an auto white balance mode specifically for outdoors, which is compatible with sodium vapor lamps.

Note

High-pressure sodium lamps are supported. Proper white balance may not be captured for some subjects when using low-pressure sodium lamps.

- **Spot AWB**

Spot AWB allows you to focus on a specific area and adjust the white balance.

The AWB range of 6 blocks vertically and 8 blocks horizontally can be designated.

When specifying this part, specify it at the starting point (1,1) and the terminating point (3,2) or at the starting point (1,2) and the terminating point (3,1). Be sure to specify at the diagonal position.

Auto Exposure Mode (AE)

A variety of AE functions are available for optimal output of subjects in lighting conditions that range from low to high.

- **Full Auto**

Iris, Gain and Shutter Speed can be set automatically.

- **Gain Limit Setting**

The gain limit can be set in AE Mode Full Auto, Shutter Priority, Iris Priority, and Spot AE. Use this setting when you want to obtain image in which signal-to-noise ratio is particularly important.

- **Shutter Priority**

Adjust with Variable Shutter Speed (1/1 to 1/10,000 sec., 16 high-speed shutter speeds plus 6 low-speed shutter speeds), Auto Iris and Gain.

- **Iris Priority**

Adjust with Variable Iris (F1.6 to F14, 13 steps), Auto Gain and Shutter speed.

- **Manual**

Adjust with Variable Shutter, Iris and Gain.

AE – Shutter Priority

The shutter speed can be set freely by the user to a total of 22 steps – 16 high speeds and 6 low speeds. When the slow shutter is set, the speed can be adjusted according to subject brightness. The picture output is read at a normal rate from the memory. The memory is updated at a low rate from the CMOS. AF following capability is lowered and also the number of frame to be displayed is decreased. In high speed mode, the shutter speed can be set up to 1/10,000s. The iris and gain are set automatically, according to the brightness of the subject.

Data	59.94/29.97 mode	50/25 mode
15	1/10000	1/10000
14	1/6000	1/6000
13	1/4000	1/3500
12	1/3000	1/2500
11	1/2000	1/1750
10	1/1500	1/1250
0F	1/1000	1/1000
0E	1/725	1/600
0D	1/500	1/425
0C	1/350	1/300
0B	1/250	1/215
0A	1/180	1/150
09	1/125	1/120
08	1/100	1/100
07	1/90	1/75
06	1/60	1/50
05	1/30	1/25
04	1/15	1/12
03	1/8	1/6
02	1/4	1/3
01	1/2	1/2
00	1/1	1/1

AE – Iris Priority

The iris can be set freely by the user to 13 steps between F1.6 and F14.

The gain and shutter speed are set automatically, according to the brightness of the subject.

Data	Setting value	Data	Setting value
11	F1.6	0A	F5.6
10	F2	09	F6.8
0F	F2.4	08	F8
0E	F2.8	07	F9.6
0D	F3.4	06	F11
0C	F4	05	F14
0B	F4.8		

AE – Manual

The shutter speed (22 steps), iris (13 steps) and gain (15 steps) can be set freely by the user.

Spot AE

In Full Auto AE, the level for the entire screen is computed and the optimum Auto Iris and Gain levels are determined. In Spot AE, a particular section of the subject can be designated, and then that portion of the image can be weighted and a value computed so that Iris and Gain can be optimized to obtain an image. For example, in an image with a lot of movement and with varying levels of brightness, portions without much change can be designated as such a “spot,” and changes to the screen can be minimized in that area. As shown in the diagram below, a range of 6 blocks vertically and 8 blocks horizontally can be designated.

When specifying this part, specify it at the starting point (1,1) and the terminating point (3,2) or at the starting point (1,2) and the terminating point (3,1). Be sure to specify at the diagonal position.

Notes

- Wide-D/HLC/Backlight Compensation does not work at the same time with Spot AE.
- The Slow AE function does not work while the Spot AE mode is turned ON.

Exposure Compensation

Exposure compensation is a function which offsets the internal reference brightness level used in the AE mode, by steps of 1.5 dB.

Data	Step	Setting value
0E	+7	+10.5 dB
0D	+6	+9 dB
0C	+5	+7.5 dB
0B	+4	+6 dB
0A	+3	+4.5 dB
09	+2	+3 dB
08	+1	+1.5 dB
07	0	0 dB
06	-1	-1.5 dB
05	-2	-3 dB
04	-3	-4.5 dB
03	-4	-6 dB
02	-5	-7.5 dB
01	-6	-9 dB
00	-7	-10.5 dB

Slow AE (Auto Exposure)

The slow AE Response function allows you to reduce the exposure response speed. Usually the camera is set up so that the optimum exposure can be obtained automatically within about 1 second. However, using the slow AE response function allows you to lengthen the auto exposure response speed from the initial setup speed (01h) to approx. 10 minutes (30h) (at normal shutter speed).

For example, with the normal setting (about 1 second), if the headlights of a car are caught by the camera, the camera automatically adjusts the exposure so that it can shoot a high-intensity subject (in this case, the headlights). As a result, images around the headlights, that is, the rest of the subject, except the headlights, becomes relatively dark, and poorly distinguished. However, using the slow AE function means the AE response speed will be slower, and response time will be longer. As a result, even if the camera catches a high-intensity subject (e.g., the headlights) for a moment, you can still easily distinguish the portions of the image surrounding the headlights.

Note

The Slow AE function does not work while the Spot AE mode is turned ON.

Aperture Control

Aperture control is a function which adjusts the edge enhancement of objects in the picture. There are 16 levels of adjustment, starting from “no enhancement.” When shooting text, this control may help by making them sharper.

Backlight Compensation

When the background of the subject is too bright, or when the subject is too dark due to shooting in the AE mode, back light compensation will make the subject appear clearer. This function operates during AE Full Auto Mode.

Note

Wide-D/HLC/Backlight Compensation/AE Mode (Manual / Iris Priority / Shutter Priority) / Spot AE do not work at the same time.

Wide Dynamic Range Mode (Wide-D)

The Wide Dynamic Range mode is a function for dividing an image into several blocks and correcting blocked-up shadows and blown-out highlights in accordance with the intensity difference. It enables you to obtain images in which portions ranging from dark to light can be recognized, even when capturing a

subject with a large intensity difference that is backlit or includes extremely light portions.

Images with wide dynamic range are produced by combining long-exposure signals (normal shutter) with the signals of the high-intensity portions obtained with a short exposure (high-speed shutter).

• About Wide-D Set Parameter

(Command: 8x 01 04 2D 00 0q 0r 0s 00 00 00 00 FF)

q: Display brightness

(0: Dark to 6: Bright)

The brightness and the darkness can be adjusted to seven levels. The normal brightness is set to 3.

Initial setting: 3

r: Brightness compensation selection

(0: Darker, 1: Dark, 2: Standard, 3: Bright)

Set the area which you want to adjust the brightness of the image with Wide-D effect.

Initial setting: 2

s: Compensation level

(0: Low, 1: Mid, 2: High)

The compensation of the brightness, which you select from the parameter, can be set to three levels.

Initial setting: 1

Notes

- When the Wide-D is On, false colors may appear in some parts of the image. This phenomenon is unique to Wide-D, and is not an indication of a camera malfunction.
- When Wide-D is switched, images may be distorted.
- Wide-D/HLC/Backlight Compensation/Spot AE do not work at the same time.
- After the Wide-D ON/OFF switchover, the Visca command will not be accepted for up to 2 seconds and an error message may be returned from the camera.
- The three types of functions : Wide-D, OSD (Title, PZM, Display), 3DNR do not work at the same time. For example, when OSD and 3DNR are on and Wide-D is turned on, 3DNR is automatically turned off. At this time, the NR mode will automatically switch to 2D/3D independent setting mode. For details, see “State transitions of the exclusive control function” on page 30.

Visibility Enhancer (VE)

Depending on the imaging scene, the Visibility Enhancer function makes the darker part of a camera image brighter, and automatically correct brightness and contrast to show bright parts clearly.

Note

This function is also used in the Wide-D operation.

Defog

When the surrounding area of the subject is foggy and low contrast, the defog mode will make the subject appear clearer.

For this function, you can select from OFF, Low, Middle and High.

HLC

HLC (highlight correction) is a function to adjust AE and AF, and to perform the masking of light area as required when a high intensity spot light is detected. It allows you to easily read the number of vehicles and number plate in the indoor parking area or in the outdoor during the night.

Note

Wide-D/HLC/Backlight Compensation/Spot AE do not work at the same time.

MinimumShutter

When the subject becomes dark, the shutter speed becomes slow, and then the gain is increased. This is a function to put a limit on the shutter speed. It prevents the camera shake when you shoot a moving subject in a dark place.

Noise Reduction (NR)

The NR function removes noise (both random and non-random) to provide clearer images. The functions of both 2D NR (removal of 2-dimensional noise) and 3D NR (removal of 3-dimensional noise) are provided. When the 2D NR level is increased, the details of image may be lost because the smoothing of image with the peripheral area is performed. Also, when the 3D NR level is increased, adverse effects such as image blur and blending in the successive images occur in the moving portion. In this function, the mode to set the level of effect by combining 2D/3D (normal setting) and the mode to individually set the level of effect respectively (independent setting) are available.

- In the normal setting, you can select the noise reduction level from 6 levels: levels 1 to 5, plus off. In this setting, the users cannot adjust the ratio of 2D/3D effect level.
- In the independent setting, you can individually select the 2D NR and 3D NR from 6 levels respectively: levels 1 to 5, plus off.

The NR effect is applied in levels based on the gain, and this setting value determines the limit of the effect. In bright conditions, changing the NR level will not have an effect.

High sensitivity mode

This function increases the max gain to allow bright output in darker environments. However, with a strong gain (up to 10×), the captured image will contain a lot of noise.

Flicker Reduction

This function automatically reduces flicker such as that caused by fluorescent light.

When the camera detects flicker, it automatically changes the shutter speed and reduces flicker.

The shutter speed is automatically selected according to conditions such as subject brightness and the Auto Slow Shutter setting.

See the table below for the shutter speed to be selected.

Monitoring mode	Flicker Frequency	Shutter speed
60 FPS	50 Hz	Auto Slow Shutter OFF: 1/100 Auto Slow Shutter ON: 1/100, 1/50, 1/25, 1/12.5
30 FPS	50 Hz	Auto Slow Shutter OFF: 1/100, 1/50 Auto Slow Shutter ON: 1/100, 1/50, 1/25, 1/12.5
50 FPS	60 Hz	Auto Slow Shutter OFF: 1/120, 1/60 Auto Slow Shutter ON: 1/120, 1/60, 1/30, 1/15
25 FPS	60 Hz	Auto Slow Shutter OFF: 1/120, 1/60, 1/30 Auto Slow Shutter ON: 1/120, 1/60, 1/30, 1/15

If the camera does not detect flicker, it will run normal AE operation.

Notes

- This function operates only during AE-Full Auto.
- Flicker Reduction does not work in AE-Shutter Priority/Iris Priority/Manual/Spot AE or Wide-D.
- After the camera detects flicker and the shutter speed is changed, Extended Normal Shutter and Minimum Shutter are inoperative.
- The Flicker Reduction may not work if the subject is bright under an environment where flicker occurs. If the shutter speed is 1/100 (flicker frequency 50 Hz) or 1/120 (flicker frequency 60Hz) and the brightness exceeds the Iris variable area (F14), stop the Flicker Reduction and run a normal AE operation.

Flicker Detection

The Flicker Detection command allows you to perform flicker detection.

Notes

- Flicker detection cannot be performed for a few seconds (approximately 6 seconds at 60/50fps, approximately 7 seconds at 30fps, approximately 8 seconds at 25fps) after turning the power-on.

- If a frequency including a folding frequency is detected, correct detection may not be possible.

Variable Gamma Mode

There are standard (00h) mode and straight gamma (01h) mode.

Gamma Offset

You can set the black level offset from -64 to $+64$ in each variable gamma mode.

Contrast Adjustment Function

You can adjust the contrast level in the range from 0 (00h) to 255 (FFh). The initial setting is 128 (80h). The smaller the value is, the lower the contrast becomes, and the larger the value is, the higher the contrast becomes.

Note

This function is available when the variable gamma mode is set to standard (00h) mode and when VE/Wide-D/HLC are set to OFF.

Temperature Reading Function

The conversion value (hex) of the temperature sensor built into the camera can be read by using a query command. The conversion value has an error of ± 3 °C, and because the temperature sensor is inside the camera, this value is not the ambient temperature. Use it as a reference value.

Image Stabilizer

Switching On the Image Stabilizer function reduces image blurring caused by, for example, vibration, which allows you to obtain images without much blurring. There are two types of levels, Super and Super+. Set the level to Super to reduce vibration. Set the level to Super+ to further reduce vibration. The Image Stabilizer function employs the digital zoom system, so the angle of view and resolution are changed, but the sensitivity is maintained.

Note

When using the Image Stabilizer function in situations where the camera itself is moving, such as panning or tilting, it is recommended to set the Image Stabilizer setting to HOLD when panning or tilting. By changing the setting from ON to HOLD before panning or tilting, and then changing the setting from HOLD to ON after panning or tilting, it is possible to suppress the recoil of blur correction when the camera stops moving.

“StableZoom”

“StableZoom” is a function for performing correction using the Image Stabilizer function in accordance with the zoom ratio, and smoothly zooming up to approximately 36 \times using a combination of the enhanced optical zoom and digital zoom. As no digital zoom by the Image Stabilizer is available on the wide side, you can obtain a wider image with no resolution degradation. Only the electronic zoom operates between Wide end and 1.2 \times , and only the enhanced optical zoom operates between 1.2 \times and Tele end. The Image Stabilizer does not work only at the Wide end. The “StableZoom” function can be switched On/Off in the register settings.

Hold Function of Image Stabilizer

With the Image Stabilizer function, suddenly stopping high-speed movement (pan, tilt, etc.) of the camera produces a blur sensor counteraction that may cause image movement. In such a case, you can use a command setting (hold) to maintain the correction of the Image Stabilizer function. In this case the image stabilizer is off, but there is no change in the angle of view.

Notes

- The image stabilizer function may not work correctly under the condition that high-frequency vibration component exists. In such a case, set the image stabilizer function to Off.
- The StableZoom and Zoom Separate mode do not work at the same time. When one function is ON, the other function cannot be turned ON.

Auto Slow Shutter On/Off

When set to “On,” the slow shutter functions automatically when the light darkens. This setting is available only when the AE mode is set to “Full Auto.” The initial setting is “Auto Slow Shutter Off.”

Low-Illumination Chroma Suppress Mode

You can configure a chroma suppress mode for low-illumination conditions. This can be useful when color noise is particularly noticeable in such conditions. Four levels (disabled and three levels) are available for the low-illumination chroma suppress mode.

ICR (IR Cut-Removable) Mode

An infrared (IR) Cut-Filter can be disengaged from the image path for increased sensitivity in low light environments. The ICR will automatically engage depending on the ambient light, allowing the camera to be effective in day/night environments.

When the auto ICR mode is set to On, the image becomes black and white.

Custom Color Gain

You can configure the color gain.

The initial setting is 4h and the setting can be set to 15 levels from 0h to Eh.

The higher the setting value, the higher the color saturation. The lower the setting value, the lower the color saturation.

Custom Color Phase

You can configure the color phase.

The initial setting is 7h and the setting can be set to 15 levels from 0h to Eh.

The higher the setting value, the color phase shifts to the + side. The lower the setting value, the color phase shifts to the – side.

Auto ICR Mode

Auto ICR Mode automatically switches the settings needed for attaching or removing the IR Cut Filter. With a set level of darkness, the IR Cut Filter is automatically disabled (ICR On), and the infrared sensitivity is increased. With a set level of brightness, the IR Cut Filter is automatically enabled (ICR Off). Also, on systems equipped with an IR light, the internal data of the camera is used to make the proper decisions to avoid malfunctions.

Auto ICR Mode operates with the AE Full Auto setting. When the Auto ICR On (Color) is set, the color is added.

Note

- Depending on the information such as brightness, etc., in the On/Off settings condition, a malfunction may occur when the subjects largely consisting of blue and green colors are taken.
- In Auto ICR On (Color), false colors may appear on the subject when under certain light sources including infrared.

Camera ID

The ID can be set up to 65,536 (0000h to FFFFh). As this will be memorized in the nonvolatile memory inside, data will be saved.

Picture Effect

It consists of the following functions.

- **Black & White:** Monochrome Image

Others

E-FLIP

This function reverses the video output from the camera vertically and horizontally.

LR Reverse

This function reverses the video output from the camera horizontally.

Freeze

This function captures an image in the field memory of the camera so that this image can be output continuously.

Note

Because communication inside the camera is based on V cycle, the captured image is always the one 3V to 4Vs after the sending of a Command. Thus, you can not specify a time period after sending EVEN, ODD or a Command.

Memory (Position preset)

Using the position preset function, 16 sets of camera shooting conditions can be stored and recalled.

This function allows you to achieve the desired status instantly, even without adjusting the following items each time.

- Zoom Position
- Digital Zoom On/Off
- Focus Auto/Manual
- Focus Position
- AE Mode
- Shutter control parameters
- Iris control parameters
- Gain control parameters
- Exposure Compensation On/Off
- Exposure Level
- Backlight Compensation On/Off
- Auto Slow Shutter On/Off
- White Balance
- R/B Gain
- Aperture Control
- ICR On/Off
- Defog
- Wide-D On/Off
- Wide-D Parameter
- VE On /Off
- VE Parameter
- Minimum Shutter Mode
- Minimum Shutter Limit
- Spot AE On/Off
- Spot AE Display On/Off
- Spot AE Parameter
- Spot AWB On/Off
- Spot AWB Display On/Off
- Spot AWB Parameter
- Spot Focus On/Off
- Spot Focus Display On/Off

• Spot Focus Parameter

Custom Preset

As with the position preset function, the camera shooting conditions can be stored and recalled. The settings are recalled when the power is turned on. *For setting items, see the “Initial settings and backup of camera” section on page 26.*

User Memory Area

This is the memory area with 16-byte capacity which users can overwrite freely. This can be used as a Serial No. for individual recognition.

Note

Rewriting of memory is not unlimited. Be careful to avoid using the memory area for such as unnecessary tasks as rewriting the contents of the memory for every operation.

Register Setting

The camera's initial settings can be changed by the register setting command.

Register Setting Command:

8x 01 04 24 mm 0p 0q FF
 mm: Register No. (=00 to 7F)
 pq: Register Value (=00 to FF)

Register Inquiry Command:

8x 09 04 24 mm FF
 mm: Register No.
 y0 50 0p 0p FF
 pp: Register Value
 (returned from the camera.)

The register setting items and No. are as follows. *For details, see “Register Setting” on page 56.*

Baud Rate: 00

Communication speed can be changed.

Monitoring Mode: 72

The output mode can be set.

LVDS Mode: 74

The LVDS output mode can be set.

Zoom Limit: 50 (Wide end), 51 (Tele end)

The Wide and Tele zoom limits can be set.

D-Zoom Max: 52

The maximum digital zoom limit can be set (initial setting is 12×).

“StableZoom”: 53

ON/OFF can be set. (initial setting is OFF.)

For details, see “StableZoom” on page 14.

FocusTrace: 54

When you want to prioritize zoom speed, set FocusTrace to Off to minimize the transition time between Wide and Tele zoom (although the image may be blurred because focus is not tracked).

FocusOffset: 55

Placing a dome cover in front of the camera may cause the focal distance of the camera to change. Especially at the Tele end, this effect exceeds the AF range, so focus cannot track. In this case, the AF range can be expanded by changing this value, but the closer to the Tele end, the longer the minimum focus distance.

Set value	00	40	80	C0	FF
Minimum focus distance	1.2 m	1.5 m	1.7 m	2 m	3 m

For details, see “Register Setting” on page 56.

AE parameter change during VE On, Defog On: 58

ON/OFF can be set. (initial setting is ON.)

Auto slow shutter limit: 59

The auto slow shutter limit can be set. (initial setting is 04.)

For details, refer to “Register Setting” (page 56).

Extended normal shutter: 5A

The lower limit of slow shutter when the Auto Slow Shutter mode is set to OFF can be set. (initial setting is OFF.)

Defog Limit: 5B, 5C, 5D

The maximum value of Defog mode in the low, mid and high levels can be set respectively.

Extended mode: 5F

ON/OFF can be set. (initial setting is OFF.)

For details, see “Extended Mode” on page 56.

Spot Light Avoidance: 20

ON/OFF can be set. (initial setting is OFF.)

Note

For the reflection timing when the register setting is changed, see the setting value reflection timings in “Register Setting” (page 56).

Privacy Zone Masking Settings

For details, see “Privacy Zone Masking Function” on page 18.

Motion detection

For details, see “Motion Detection (MD) Function” on page 20.

Title Display

- You can set a title of up to 11 lines. One line can contain up to 20 characters.
- You can set display on/off, the horizontal position of the first character, blinking state and color for each line.
- The camera gives priority to a title display when the camera status is displayed on the relevant line. On the lines where a title is not set, the camera status is displayed.

Line Number	00h to 0Ah	
H-position	00h to 1Fh	
Color	00h	WHITE
	01h	YELLOW
	02h	VIOLET
	03h	RED
	04h	CYAN
	05h	GREEN
	06h	BLUE

Privacy Zone Masking Function

Privacy Zone masking protects private objects and areas such as house windows, entrances, and exits which are within the camera's range of vision but not subject to surveillance.

Privacy zone masking can be masked on the monitor to protect privacy.

Features

- Mask can be set on up to 24 places according to Pan/Tilt positions.
- Mask can be displayed on 8 places per screen simultaneously.
- Individual on/off zone masking settings.
- Two colors can be individually set for each of 24 privacy zones.
- Interlocking control with zooming.
- Interlocking control with Pan/Tilt.
- Non-interlocking control with Pan/Tilt.

Details of Setting Commands

Set Mask

Command: 8x 01 04 76 mm nn 0r 0r 0s 0s FF

Parameters:

mm	Setting Mask See "mm: Mask setting list" in "Parameters" on page 19.
nn	Selects new setting or resetting for the zone. See "nn:Setting" in "Parameters" on page 19.
rr	Sets the half value "w" of the Mask Width.
ss	Sets the half value "h" of the Mask Height. See "pp: x, qq: y, rr: w, ss: h" in "Parameters" on page 19.

Comments: To set the mask, first display the object at the center of the screen. When "nn" is set to 1, the current Pan/Tilt/Zoom Position is recorded in internal memory.

When "nn" is set to 0, the Pan/Tilt/Zoom Position in memory is not changed.

Notes

- The tilt angle at which you can set the mask is between -70 to +70 degrees.
- It is recommended that you set the size to at least twice the size of the object (height and width).

Set Display

Command: 8x 01 04 77 pp pp pp pp FF

Parameter:

pp pp pp pp	Each 24 Privacy Zones corresponds to the BIT. See "pp pp pp pp: Mask bit" in "Parameters" on page 19.
-------------	--

Comments: Each of 24 Privacy zones can be switched on and off individually by a single VISCA Command. If you want to display a Privacy zone, you must set its bit to 1. If you do not want to display a Privacy zone, you must set its bit to 0.

Set Mask Color

Command: 8x 01 04 78 pp pp pp pp qq rr FF

Parameter:

pp pp pp pp	Each 24 Privacy Zones correspond to the BIT. See "pp pp pp pp: Mask bit" in "Parameters" on page 19.
qq	Set the color code
rr	Set the color code. See "qq, rr: Color code" in "Parameters" on page 20.

Comments: Two different color masks can be chosen. Two colors can be individually set for each of 24 privacy zones.

If the bit of parameter (pp pp pp pp) is set to "0", mask color will be "qq" color (Color code). If the bit of parameter (pp pp pp pp) is set to "1", the mask color will be "rr" color (Color code).

Example: 8x 01 04 78 00 00 00 03 00 07 FF

The mask color of Mask_A and Mask_B is White (color code 07h), and the mask color of the other Mask (C to X) is Black (color code 00h).

Set Pan Tilt Angle

Command: 8x 01 04 79 0p 0p 0p 0q 0q 0q FF

Parameter:

ppp	Pan Angle
qqq	Tilt Angle See "Setting pan/tilt angle" in "Parameters" on page 20.

Comments: Pan/Tilt angle settings are hexadecimal data.

The resolution of Pan/Tilt angle is 0.088 degrees.

Notes

When you set the pan/tilt angle, locate the pan/tilt position at the center point of the FCB camera's position.

Set PTZ Mask

Command: 8x 01 04 7B mm 0p 0p 0p 0q 0q 0q 0r 0r 0r 0r FF

Parameter:

mm	Setting Mask See “mm: Mask setting list” in “Parameters” on page 19.
ppp	Pan Angle (000 to FFF) See “Setting pan/tilt angle” in “Parameters” on page 20.
qqq	Tilt Angle (000 to FFF) See “Setting pan/tilt angle” in “Parameters” on page 20.
rrrr	Zoom Position (000 to 4000) See “Zoom Ratio and Zoom Position (for reference)” on page 54.

Comments: Mask can be set at the desired position by setting the pan tilt angle and zoom position using this command.
The set value can be input by hexadecimal number.

Note

Privacy mask zone follows the change of angle of view according to zoom. However, the follow might be delayed for a moment if there is any big change, such as when using D-Zoom or E-FLIP.

Non Interlock Mask

Command: 8x 01 04 6F mm 0p 0p 0q 0q 0r 0r 0s 0s FF

Parameters:

mm	Setting Mask See “mm: Mask setting list” in “Parameters” on page 19.
pp	Sets the center position “x” of the Mask on screen.
qq	Sets the center position “y” of the Mask on screen.
rr	Sets the half value “w” of the Mask Width.
ss	Sets the half value “h” of the Mask Height. See “pp: x, qq: y, rr: w, ss: h” in “Parameters” on page 19.

Commands: Mask does not interlock with pan/tilt.
The limitations of parameters are as follows.
(hexadecimal representation)

x: ±50h w: ±50h
y: ±2Dh h: ±2Dh

Note

When the Set Mask command and the Non Interlock Mask command are set to the same mask, the command set later becomes effective.

Parameters

mm: Mask setting list

Mask Name	mm (Hex)	Mask Name	mm (Hex)
Mask_A	00h	Mask_M	0Ch
Mask_B	01h	Mask_N	0Dh
Mask_C	02h	Mask_O	0Eh
Mask_D	03h	Mask_P	0Fh
Mask_E	04h	Mask_Q	10h
Mask_F	05h	Mask_R	11h
Mask_G	06h	Mask_S	12h
Mask_H	07h	Mask_T	13h
Mask_I	08h	Mask_U	14h
Mask_J	09h	Mask_V	15h
Mask_K	0Ah	Mask_W	16h
Mask_L	0Bh	Mask_X	17h

nn: Setting

nn	Setting
00h	Resetting the zone size (the value of w, h) for the existing mask.
01h	Setting newly the zone size (the value of w, h).

pp: x, qq: y, rr: w, ss: h

Note

The priority order of the mask display is in the sequence from A (highest) to X (lowest). When you set the parameters of masks non-sequentially, it is recommended that you set the mask whose priority order is higher, first.

pp pp pp pp: Mask bit

	pp								pp							
bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Mask	-	-	X	W	V	U	T	S	-	-	R	Q	P	O	N	M

	pp								pp							
bit	7	6	5	4	3	2	1	0	7	6	5	4	3	2	1	0
Mask	-	-	L	K	J	I	H	G	-	-	F	E	D	C	B	A

The “-” must be “0”.

qq, rr: Color code

Mask (color)	Code (qq, rr)
Black	00 h
Gray1	01 h
Gray2	02 h
Gray3	03 h
Gray4	04 h
Gray5	05 h
Gray6	06 h
White	07 h
Red	08 h
Green	09 h
Blue	0A h
Cyan	0B h
Yellow	0C h
Magenta	0D h

Setting pan/tilt angle

Motion Detection (MD) Function

This function instructs the camera to detect movement within the monitoring area and then send an alarm signal automatically.

The Detect signal goes out through the VISCA Command.

Features

- You can set a frame for the detection range of 16 (horizontally) × 12 (vertically) blocks.
- You can set up to four frames.
- When the motion is detected in the set frame, the Alarm Replay VISCA Command is sent.
- The threshold level for detection can be set (common to four frames).
- The interval of alarm detection can be set up to 255 seconds in units of one second.
- You can select ON/OFF for each frame.
- The frame number is also sent with Alarm Replay to report in which frame the motion has been detected.

Frames

Setting frames

You can set the frame by assigning the starting point and terminating point vertically and horizontally. You can set up to four frames.

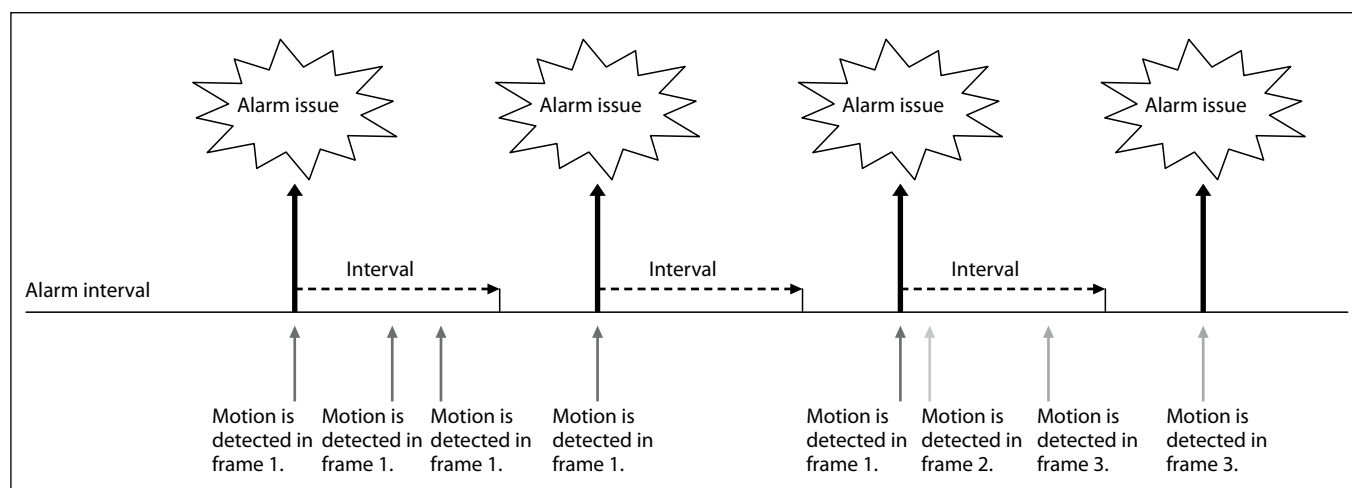

When motion is detected within the range where frames overlap

The alarms are sent for both frames.

Sending Alarms

- When motion is detected, the Alarm Replay command is issued via the serial command (VISCA) communication line.
- When multiple motions are detected or motion is detected in another frame within the set interval following the original time the alarm was issued, another alarm command is not issued.
- When motion is detected after the interval time elapsed, the alarm is issued again.

Setting Commands

• MD On/Off

The Display mode is selected by the Function Set command and frames are set by the Frame Set command. By sending an MD On command, the frame is displayed when motion is detected in the set frame. The Alarm Reply command is sent via the serial command (VISCA) communication line.

8x 01 04 1B 02 FF --- On

8x 01 04 1B 03 FF --- Off

• Function Set

Select the detected frame, and set the Threshold Level and the Interval Time.

8x 01 04 1C 0m 0n 0p 0q 0r 0s FF

m: Display Mode on/off (bit0)

n: Detection Frame set on/off (bit0:Frame0, bit1: Frame1, bit2:Frame2, bit3:Frame3)

- (0 to F)

pq: Threshold - (00 to FF)

rs: Interval time set - (00 to FF)

(When pq and rs are 0, the command is received, but the setting is disabled.)

• Window Set

You can set up to four frames by assigning the starting and terminating points.

Notes

- Set a terminating point higher vertically and horizontally than the starting point. If you set the wrong value, an error occurs.
- It is recommended to set the frame setting a little larger to account for lens distortion.

8x 01 04 1D 0m 0p 0q rr 0s FF

m: Select Detection Frame (0: Frame0, 1: Frame1, 2: Frame2, 3: Frame3) - (0, 1, 2, 3)

p: Start Horizontal Position - (0 to F)

q: Start Vertical Position - (0 to B)

rr: Stop Horizontal Position - (01 to 10)

s: Stop Vertical Position - (1 to C)

• Alarm Reply

When motion is detected in the set frame, the camera issues this command. This command includes the information on the number of the detected frame.

y0 07 04 1B 0p FF

p: Frame Number (bit0: Frame0, bit1: Frame1, bit2: Frame2, bit3: Frame3)

Extended Commands

Extended commands support the following functions (described previously).

Turn on this mode (for details, see “Extended Mode” in “Register Setting” on page 56) to enable the following functions.

- **Exposure Compensation**

The setting can be set in steps of approximately 0.2dB (–128 (00h) to approximately +127 (FFh)).

For details, see page 11.

- **Aperture Control**

The setting can be set to 256 levels (00h to FFh).

For details, see page 12.

- **Custom Color Gain**

You can configure the color gain.

The initial setting is 80h and the setting can be set to 256 levels from 00h to FFh.

The higher the setting value, the higher the color saturation. The lower the setting value, the lower the color saturation.

You can set the color saturation more widely and finely than the normal color gain variable.

For details, see page 15.

- **Custom Color Phase**

You can configure the color phase.

The initial setting is 80h and the setting can be set to 256 levels from 00h to FFh.

The higher the setting value, the color phase shifts to the + side. The lower the setting value, the color phase shifts to the – side.

You can set the color phase more finely than the normal color phase variable.

For details, see page 15.

- **Auto ICR Mode**

The setting of ICR ON→OFF threshold can be set when Auto ICR is on.

The setting range is 0 step (00h) to 255 step (FFh).

The setting of ICR OFF→ON threshold (On Level) can be set when Auto ICR is on.

The setting range is 0 step (00h) to 28 step (1Ch).

For details, see page 15.

Note

When the extended mode is Off, CMD_NOT_EXEC will be returned if you send the extended commands to the camera.

When the extended mode is On, CMD_NOT_EXEC will be returned if you send the normal commands to the camera.

Firmware Update

Overview

This section describes the firmware update procedure. To perform the firmware version upgrade, the following three steps are required.

- 1) Shifting to the maintenance mode using the Visca command
- 2) Binary transmission (X modem protocol) of the firmware in the maintenance mode
- 3) Finalizing setting using the Visca command

Each step is described as follows.

- 1) **Shifting to the maintenance mode using the Visca command**

After entering the standby mode using the Visca command, the unit shifts to the maintenance mode. Note that if the power is turned off during the writing, the program will be broken and cannot be restored.

- 2) **Binary transmission (X modem protocol) of the firmware in the maintenance mode**

Serial Port Setting during maintenance mode

Communication Speed	115200 bps
Data bit	8 bit
Parity	None
Stop bit	1 bit
Flow control	None

In the maintenance mode, the terminal software capable of sending the character command is used.

The terminal software that is provided with the XMODEM binary transfer protocol is used.

When you transfer the camera firmware (uug.bin file) using this function, the transferred file is written in FlashROM. The writing takes approximately 10 minutes.

Note that if the power is turned OFF during writing, the program may be broken and may not be restorable.

After the writing is completed, the unit restarts automatically, and then the camera firmware is started.

- 3) **Finalizing setting using the Visca command**

The finalizing setting is performed using the Visca command.

You cannot read the correct camera firmware version without performing this setting. Be sure to perform this setting.

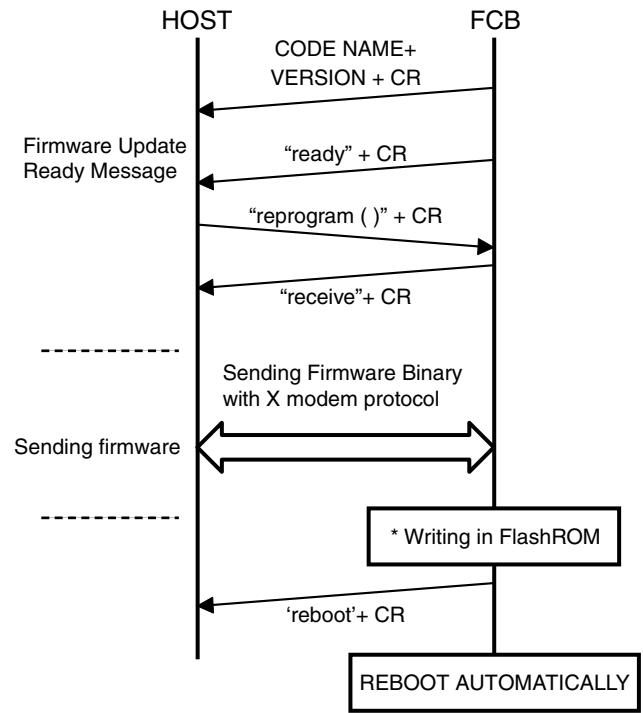

Update Procedure

Enter Maintenance Mode

* Do not turn OFF the power while updating because there is a possibility that the camera will break.

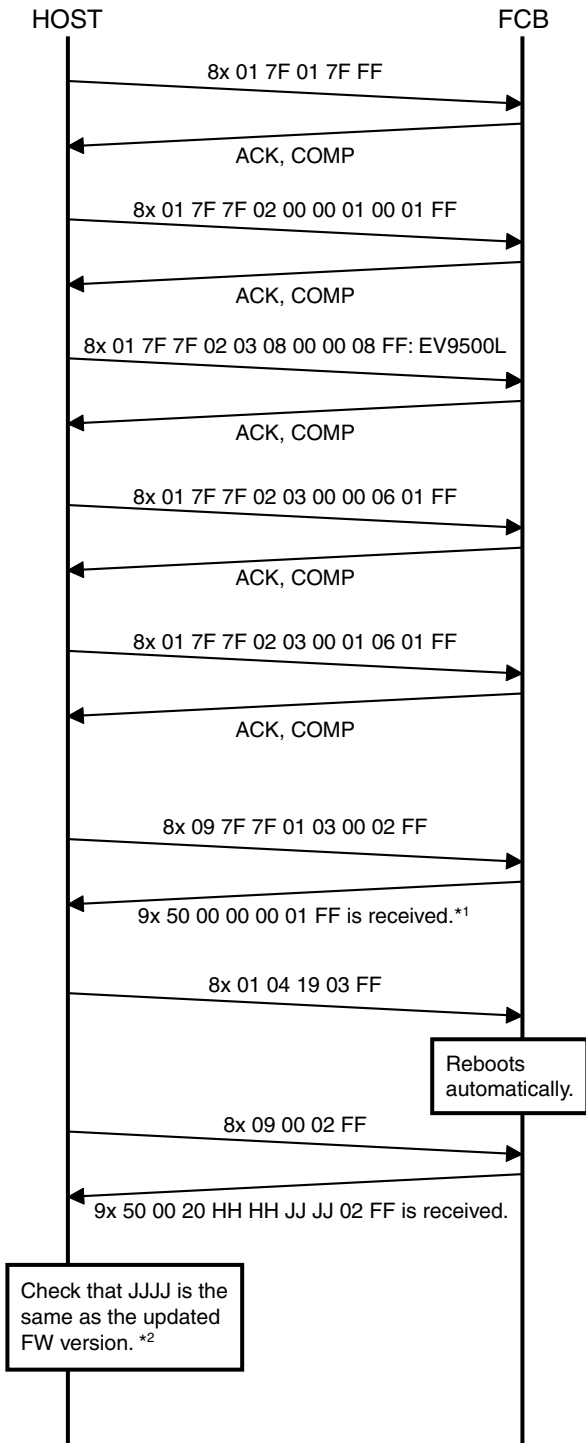

Maintenance Mode

* Do not turn OFF the power while updating because there is a possibility that the camera will break.

Finalizing procedure

After the maintenance mode, perform the following finalizing procedure.

*1 When 9x 50 00 00 00 01 FF is received, retransmit 8x 09 7F 7F 01 03 00 02 FF until 9x 50 00 00 00 01 FF is received.

*2 If it is not the same, perform the update procedure from the beginning.

Eclipse

When designing the housing, refer to the dimensional allowance as shown in the figure below.

Spectral Sensitivity Characteristics

Use the graph as a reference value. (We can not guarantee these values.)

This data is measured when the IR cut filter is removed and the characteristics of the lens and optical source characteristics are ignored.

Initial settings and backup of camera

“Initial settings” is the factory preset value.

“Custom Preset”, indicates data that can be stored with ○ and data that cannot be stored with × using the custom preset function.

“Back up on standby” indicates that ○ is retained while on Standby and × is not retained.

Mode/Position setting	Initial Settings	Custom Preset	Back up at standby

Command List

VISCA/RS-232C Commands

This Manual outlines an RS-232C control protocol and command list for certain Sony cameras from which control software can be developed.

THIS CONTROL PROTOCOL AND COMMAND LIST IS PROVIDED BY SONY ON AN "AS-IS BASIS" WITHOUT WARRANTY OF ANY KIND. SONY DOES NOT WARRANT ANY PARTICULAR RESULT FROM THE USE OF THIS CONTROL PROTOCOL AND COMMAND LIST AND DISCLAIMS AND EXCLUDES ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THAT CONTROL PROTOCOL AND COMMAND LIST, INCLUDING, BUT NOT LIMITED TO, ANY OR ALL IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. IN FACT, SONY SPECIFICALLY ACKNOWLEDGES THAT SOFTWARE DEVELOPED BASED ON THIS CONTROL PROTOCOL AND COMMAND LIST MAY CAUSE MALFUNCTION OR DAMAGE TO HARDWARE AND SOFTWARE USED WITH IT (INCLUDING SONY HARDWARE AND SOFTWARE) AND SPECIFICALLY DISCLAIMS ANY LIABILITY FOR ANY SUCH MALFUNCTION OR DAMAGE. THIS CONTROL PROTOCOL AND COMMAND LIST SHOULD BE USED WITH CAUTION.

Overview of VISCA

In VISCA, the device outputting commands, for example, a computer, is called the controller. The device receiving the commands, an FCB camera is called the peripheral device. In VISCA, up to seven peripheral devices like the FCB camera can be connected to one controller using communication conforming to the RS-232C standard. The parameters of RS-232C are as follows.

- Communication speed: 9.6 kbps/19.2 kbps/38.4 kbps/115.2 kbps
- Data bits : 8
- Start bit : 1
- Stop bit : 1
- Non parity

Flow control using XON/XOFF and RTS/CTS, etc., is not supported.

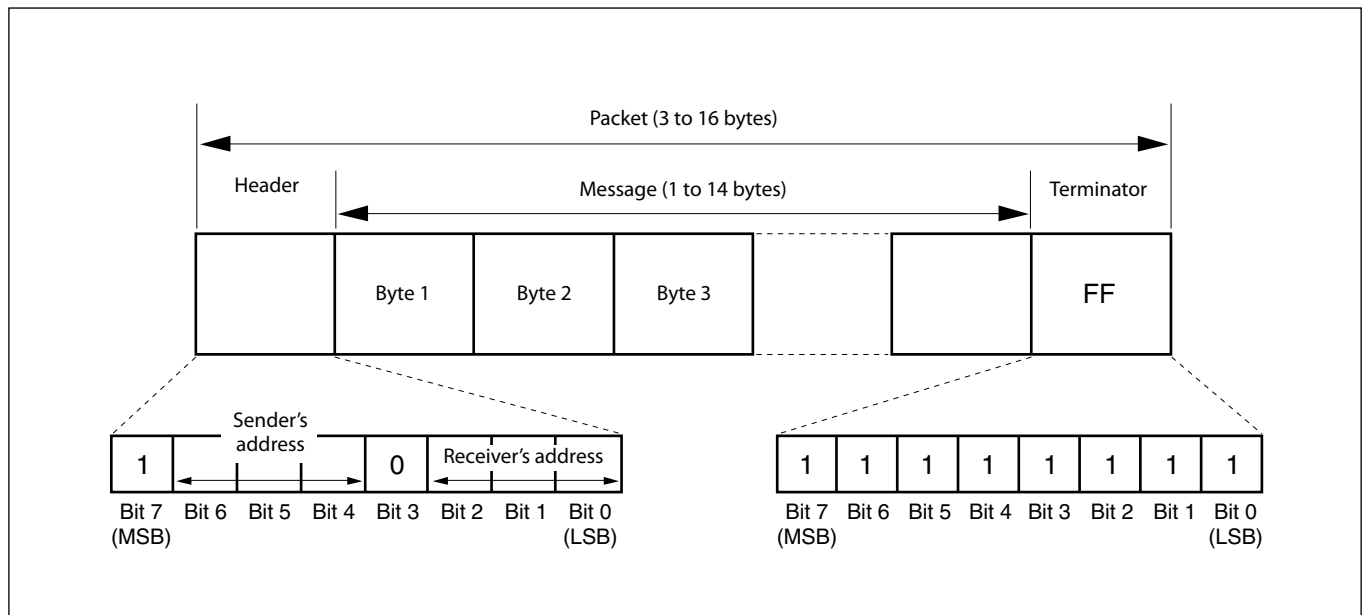

VISCA Communication Specifications

VISCA packet structure

The basic unit of VISCA communication is called a packet. The first byte of the packet is called the header and comprises the sender's and receiver's addresses. For example, the header of the packet sent to the FCB camera assigned address 1 from the controller (address 0) is hexadecimal 81h. The packet sent to the camera assigned address 2 is 82h. In the command list, as the header is 8X, input the address of the camera at X. The header of the reply packet from the camera assigned address 1 is 90h. The packet from the camera assigned address 2 is A0h.

Some of the commands for setting cameras can be sent to all devices at one time (broadcast). In the case of broadcast, the header should be hexadecimal 88h.

When the terminator is FFh, it signifies the end of the packet.

Command and inquiry

- **Command**
Sends operational commands to the FCB camera.
- **Inquiry**
Used for inquiring about the current state of the FCB camera.

	Command Packet	Note
Inquiry	8X QQ RR ... FF	QQ ¹⁾ = Command/Inquiry, RR ²⁾ = category code

¹⁾ QQ = 01 (Command), 09 (Inquiry)

²⁾ RR = 00 (Interface), 04 (camera 1), 06 (Pan/Tilt), 07 (camera 2)

X = 1 to 7: FCB camera address

Responses for commands and inquiries

● Acknowledge message

Returned by the FCB camera when it receives a command. No Acknowledge message is returned for inquiries.

● Completion message

Returned by the FCB camera when execution of commands or inquiries is completed. In the case of inquiry commands, it will contain reply data for the inquiry after the 3rd byte of the packet. If the Acknowledge message is omitted, the socket number will contain 0.

	Reply Packet	Note
Acknowledge	X0 4Y FF	Y = socket number
Completion (Commands)	X0 5Y FF	Y = socket number
Completion (Inquiries)	X0 5Y ... FF	Y = socket number

X = 9 to F: FCB camera address + 8

● Error message

When a command could not be executed or failed, an error message is returned instead of the Acknowledge message. After an Acknowledge message, an error message may be returned if the process of some command (zoom, etc.) has not been completed.

When an inquiry command could not be executed or failed, an error message is returned instead of the completion message.

Error Packet	Description
X0 6Y 01 FF	Message length error (>14 bytes)
X0 6Y 02 FF	Syntax Error
X0 6Y 03 FF	Command buffer full
X0 6Y 04 FF	Command cancelled
X0 6Y 05 FF	No socket (to be cancelled)
X0 6Y 41 FF	Command not executable

X = 9 to F: FCB camera address + 8, Y = socket number

Socket number

When command messages are sent to the FCB camera, send the next command message after waiting for the completion message or error message to return.

However to deal with advanced uses, the FCB camera has two buffers (memories) for commands, so that up to two commands including the commands currently being executed can be received. When the FCB camera receives commands, it notifies the sender which command buffer was used using the socket number of the Acknowledge message. As the completion message or error message also has a socket number, it indicates which command has ended. Even when two command buffers are being used at any one time, an FCB camera management command and some inquiry messages can be executed.

The Acknowledge message is not returned for these commands and inquiries, and only the completion message of socket number 0 is returned.

Command execution cancel

To cancel a command which has already been sent, send the Cancel command as the next command. To cancel one of any two commands which have been sent, use the cancel message.

	Cancel Packet	Note
Cancel	8X 2Y FF	Y = socket number

X = 1 to 7: FCB camera address, Y = socket number

An error message will be returned for this command, but this is not a fault. It indicates that the command has been canceled.

VISCA Device Setting Command

Before starting control of the FCB camera, be sure to send the Address command and the IF_Clear command using the broadcast function.

For VISCA network administration

- **Address**

Sets an address of a peripheral device. Use when initializing the network, and receiving the following network change message.

- **Network Change**

Sent from the peripheral device to the controller when a device is removed from or added to the network. The address must be re-set when this message is received.

	Packet	Note
Address	88 30 01 FF	Always broadcasted.
Network Change	X0 38 FF	

X = 9 to F: FCB camera address + 8

Note

Please start the camera and start sending the VISCA command after receiving the Network Change.

VISCA interface command

- **IF_Clear**

Clears the command buffers in the FCB camera and cancels the command currently being executed.

	Command Packet	Reply Packet	Note
IF_Clear	8X 01 00 01 FF	X0 50 FF	
IF_Clear (broadcast)	88 01 00 01 FF	88 01 00 01 FF	

X = 1 to 7: FCB camera board address (For inquiry packet)
X = 9 to F: FCB camera board address +8 (For reply packet)

VISCA interface and inquiry

- **CAM_VersionInq**

Returns information on the VISCA interface.

Inquiry	Inquiry Packet	Reply Packet	Description
CAM_VersionInq	8X 09 00 02 FF	Y0 50 GG GG HH HH JJ JJ KK FF	GGGG = Vender ID (0020: Sony) HHHH = Model ID 070E: FCB-EV9500L JJJJ = ROM revision KK = Maximum socket #(02)

X = 1 to 7: FCB camera address (For inquiry packet)
X = 9 to F: FCB camera address +8 (For reply packet)

VISCA Command/Acknowledge Protocol

Command	Command Message	Reply Message	Comments
General Command	81 01 04 38 02 FF (Example)	90 41 FF (Acknowledge) +90 51 FF (Completion) 90 42 FF 90 52 FF	Returns Acknowledge when a command has been accepted, and Completion when a command has been executed.
	81 01 04 38 FF (Example)	90 60 02 FF (Syntax Error)	Accepted a command which is not supported or a command lacking parameters.
	81 01 04 38 02 FF (Example)	90 60 03 FF (Command Buffer Full)	There are two commands currently being executed, and the command could not be accepted.
	81 01 04 08 02 FF (Example)	90 61 41 FF (Command Not Executable) 90 62 41 FF	Could not execute the command in the current mode.
Inquiry Command	81 09 04 38 FF (Example)	90 50 02 FF (Completion)	Acknowledge is not returned for the inquiry command.
	81 09 05 38 FF (Example)	90 60 02 FF (Syntax Error)	Accepted an incompatible command.
Address Set	88 30 01 FF	88 30 02 FF	Returned the device address to +1.
IF_Clear(Broadcast)	88 01 00 01 FF	88 01 00 01 FF	Returned the same command.
IF_Clear (For x)	8x 01 00 01 FF	z0 50 FF (Completion)	Acknowledge is not returned for this command.
Command Cancel	8x 2y FF	z0 6y 04 FF (Command Canceled)	Returned when the command of the socket specified is canceled. Completion for the command canceled is not returned.
		z0 6y 05 FF (No Socket)	Returned when the command of the specified socket has already been completed or when the socket number specified is wrong.

VISCA Camera-Issued Messages

Acknowledge/Completion Messages

	Command Messages	Comments
Acknowledge	z0 4y FF (y:Socket No.)	Returned when the command is accepted.
Completion	z0 5y FF (y:Socket No.)	Returned when the command has been executed.

z = Device address + 8

Error Messages

	Command Messages	Comments
Syntax Error	z0 60 02 FF	Returned when the command format is different or when a command with illegal command parameters is accepted.
Command Buffer Full	z0 60 03 FF	Indicates that two sockets are already being used (executing two commands) and the command could not be accepted when received.
Command Canceled	z0 6y 04 FF (y:Socket No.)	Returned when a command which is being executed in a socket specified by the cancel command is canceled. The completion message for the command is not returned.
No Socket	z0 6y 05 FF (y:Socket No.)	Returned when no command is executed in a socket specified by the cancel command, or when an invalid socket number is specified.
Command Not Executable	z0 6y 41 FF (y:Socket No.)	Returned when a command cannot be executed due to current conditions. For example, when commands controlling the focus manually are received during auto focus.

Network Change Message

	Command Message	Comments
Network Change	z0 38 FF	Issued when power is being routed.

		1	On	

*1: Timing to reflect register setting value changes

- Reflect after camera reset: After the setting value is changed, changes are reflected following camera reset by "Camera reset command" or "Camera power supply turned OFF and then ON again".
- Reflect immediately: Changes are reflected immediately after the setting value is changed.

Specifications

Imager	1/1.8 Type STARVIS CMOS Sensor	Back light compensation	On/Off
Picture elements	4170K pixels	Electronic shutter speed	1/1 sec to 1/10000 sec (22 steps)
Lens	f= 6.5 mm (WIDE) to 162.5 mm	White Balance	Auto, ATW, Indoor, Outdoor, One Push WB, Manual WB, Outdoor Auto, Sodium Vapor Lamp (Fix/Auto/Outdoor Auto)
(Typical value)	(TELE), F1.6 to F4.8	Gain	Auto/Manual (0 to 50.0 dB (0 to 28 step)) Max. Gain Limit (10.7 to 50.0 dB (6 to 28 step))
	Zoom movement speed	Wide Dynamic Range Mode	On/Off
	WIDE – TELE	Noise Reduction	On/Off (level 5 to 1 / Off, 6 steps)
	5.3 sec (Focus Tracking On)	Defog	On/Off (low, mid, high)
	2.8 sec (Focus Tracking Off)	Aperture control	16 steps
	WIDE – Digital TELE (Digital 12×)	Preset	16-POSITIONS
	6.6 sec (29.97p/59.94p mode)	Camera control	VISCA protocol (CMOS 3.3 V level, 5.5 V tolerant)
	6.9 sec (25p/50p mode)		9.6 kbps, 19.2 kbps, 38.4 kbps, 115.2 kbps, Stop bit, 1 bit
	Digital WIDE – Digital TELE (Digital 12×)	Video Output	Digital (LVDS)
	1.4 sec (29.97p/59.94p mode)	Storage temperature/Humidity	-20 °C to +60 °C (-4 °F to +140 °F)/ 20% to 95% Absolute humidity: 36 g/m ³
	1.6 sec (25p/50p mode)	Operating temperature/Humidity	-5 °C to +60 °C (23 °F to +140 °F)/ 20% to 80% Absolute humidity: 36 g/m ³
	Focus Movement time	Power requirements	7 V to 12 V DC
	∞ to Near 1.4 sec	Power consumption	5.5 W (during motor operation: 7.8 W)
Zoom	Enhanced optical zoom 30×	Mass	Approx. 456 g (1 lb. 0.085 oz.)
Digital Zoom	12× (max. 432× with StableZoom)	Dimensions	56 × 64 × 125 mm (2 1/4 × 2 5/8 × 5 in.) (w/h/d)
Angle of view (H)	Approx. 58.1 degrees (Wide end), approx. 2.3 degrees (Tele end)		
Min. working distance	100 mm (Wide end), 1200 mm (Tele end)		
Sync system	Internal		
Min. illumination (Typical value)	In the case of ICR-Off 0.009 lx (1/30 sec, 50%, High Sensitivity mode On) 0.09 lx (1/30 sec, 50%, High Sensitivity mode Off) 0.0012 lx (1/4 sec, 1/3 sec, 50%, High Sensitivity mode On) 0.012 lx (1/4 sec, 1/3 sec, 50%, High Sensitivity mode Off) In the case of ICR-On 0.00008 lx (1/30 sec, 50%, High Sensitivity mode On) 0.00063 lx (1/30 sec, 50%, High Sensitivity mode Off) 0.000005 lx (1/4 sec, 1/3 sec, 30%, High Sensitivity mode On)		
Recommended illumination	100 lx to 100,000 lx		
Image S/N	50 dB (Weight On)		

DIGITAL Image Output Y, Pb, Pr 4:2:2 FORMAT

Color coding complies with BT709.

Interface

- In FCB-EV9500L, the video signal is transmitted by using LVDS. The LVDS receiver IC chip (e.g., THC63LVD1024, THC63LVD104C, BU90R102) is recommended.
- Recommended connectors and cables
 Cable: #42 Micro coaxial cable
 Connector: USL20-30S (KEL)

LVDS receiver circuit example ③ (Double output)

- No.1 and 2 of S601 adjust the signal delay. No.3 selects whether to input the rising edge or falling edge of the signal.

LVDS receiver IC chip (e.g., THC63LVD1024, BU90R102)
