HOW TO PREVENT AIRBORNE ALLERGIES WITH PROBIOTIC AIR OPTIMIZER - AN EASY WAY TO PREVENT ALLERGIES FOR YOU AND YOUR PETS!

The independent Laboratory studies show that EVAA+ Probiotic Air Optimizer (for homes) and DENAA+ Probiotic Air Optimizer (for public places):

- Can reduce 43% of dust mite allergens in one hour.
- Can reduce pollens by 20% in one hour.
- Can reduce cat allergen by 57,9% in one hour.
- Continue to reduce dust mite allergens by up to 70% of allergens over the following 72 hours.

What is Airborne Allergy?

There are three main types of allergens: Respiratory allergies are the most common, followed by contact allergies and then food allergies:

1

Airborne

includes pollen, mites, mold spores and animal hair. The most common airborne allergies – more than two thirds of all allergies – are caused by mites and pollen. These cause respiratory and skin symptoms.

2

Chemical

includes everyday household cleaning products, air fresheners and candles as well as synthetic materials (furniture, paint, glue, etc.). Many of these common chemicals contain allergenic substances that can trigger an immune system response. They also release volatile organic compounds (VOCs) into the air. These VOCs irritate the respiratory tract and mucous membranes. Read our article Polluted Pets to find out more. This focus is on pets, but applies equally to humans too.

3

Food

includes adverse reactions to cow's milk and wheat.

If you suffer from hay fever, 'Allergy Season' probably means 'pollen season'. This can last from around March to October – a significant time – but your own allergy season may be different, depending on what you are sensitive to: May is often worse for grass pollen allergies and June is often worse for tree pollen. September can trigger hay allergies.

HOW TO PREVENT AIRBORNE ALLERGIES WITH PROBIOTIC AIR OPTIMIZER - AN EASY WAY TO PREVENT ALLERGIES FOR YOU AND YOUR PETS!

In contrast, dust mite allergy is a problem all year around. It may increase in September when Autumn arrives and we get cosy inside, close the curtains and put the heating on.

What is Dust Mite Allergy?

If you suffer from dust mite allergy, you'll know how uncomfortable the symptoms can be. Respiratory reactions are often similar to hay fever (sneezing, itchy eyes and runny nose) and asthma (wheezing, coughing and difficulty breathing). Skin reactions include atopic and contact dermatitis; tiredness and poor concentration are also common.

But to be accurate, these dust mite allergy symptoms are not triggered by dust or the mites themselves. They are triggered by proteins in the droppings and secretions that the mites leave behind on textiles and surfaces.

As dust mites are spider-like organisms, that produce around twenty waste droppings each every day, this can cause significant problems! They are in houses and other buildings, all year round. They thrive in warm, humid environments - dust particles that float in the air and in soft furnishings

They are too small to see without a microscope. They feed on skin flakes from humans and pets, so have a constant food supply. One mattress alone can contain nearly 2 million dust mites (It's best not to think about it!)

As with many illnesses, prevention is better than cure. Luckily, there is an easy to prevent airborne allergies caused by this: **Simply reduce the number of dust mites in your indoor environment.** This immediately helps to reduce your symptoms and can also reduce your need for anti-allergy medication.

HOW TO PREVENT AIRBORNE ALLERGIES WITH PROBIOTIC AIR OPTIMIZER - AN EASY WAY TO PREVENT ALLERGIES FOR YOU AND YOUR PETS!

Probiotic Research Study Shows How to Prevent Airborne Allergies

The Provilan Air Optimizer Report demonstrates that EVAA+ Probiotic Air Optimizer and DENAA+ Probiotic Commercial Air Optimizer can:

Reduce 43% of dust mite allergens in one hour.
Reduce pollens by 20% in one hour.
Reduce cat allergen by 57,9% in one hour.
Continue to reduce dust mite allergens by up to 70% of allergens over the following 72 hours.

The Air Optimizer contains healthy 'good' bacteria (probiotics), naturally sourced from plants. These helpful probiotics are live microorganisms that simply consume the organic allergens – in this case dust mite poop and pollen – as a natural food source. This innovative biotechnology is available as an easy-to-use natural spray: Simply spray into air and onto textiles, furniture and bedding.

In order to support health and immunity, an all-round bio-allergen free home environment is crucial for you and your pet, we also recommend allergy free home & pet package.
