As a general rule, satin columns should not be less than 1 mm in width or exceed 9-11 mm in width. Both underlay and pull compensation are important to achieve the highest quality results. **Minimum specifications are recommendations only. Smaller or larger results can be achieved by adjusting properties.** Pull compensation and density can be modified from the properties. To make further adjustments, convert text to segments. **Make any adjustments to settings as necessary according to type of material.** Kerning adjustments are normal. Always run a test prior to running production. Lock stitches are important to prevent thread from unraveling.
