

REDUCED REDNESS AND SMOOTHER SKIN

Before starting the treatment, the patient's skin was reddish with a high density of red pimples (Image 1A). The area affected reaches from the ear until the eyebrows and on the whole area of the cheek.

After treatment with Bioptron Hyperlight Therapy for 3 weeks, 10 minutes/day, the number of red pustules decreased drastically (Image 1B). Not only was the number of pustules reduced, but also the skin was not red anymore and it became smoother.
