Next-Gen Power Supply Upgrade

Discover **every nuance** at a dealer near you

Innuos.com

The STATEMENT Next-Gen Power Supply Upgrade is the result of Innuos ongoing Research and Development efforts in close collaboration with the long-term partner Dr. Sean Jacobs. The impressive improvement in sound quality is achieved by an innovative Power Supply design and significant component upgrades:

The Power section uses two custom-designed ARC6 AC/DC modules - each containing a new high-precision Active Rectifier board, a massive 10mH DC Choke and almost 4 times more capacitance provided by six Mundorf caps. The ARC6 modules are mounted on the new Adaptive Vibration Control (AVC) platform - a combination of Panzerholz wood with a specific density gel layer, which is highly effective at dampening high-frequency vibration coming from the chassis.

In the Server section, the Regulator modules include a dedicated CPU Booster module, providing up to 15A of current to the CPU for faster transients. All rails are further smoothed by new Audio Note KAISEI capacitors benefitting all the main components: Motherboard, USB Reclocker, Ethernet Clock module and SSD.

The results are crystal clear: **Increased realism with even more detailed textures, expansive soundstage and improved dynamics.**

The STATEMENT PSU Upgrade will be available as an option for both new or existing units.
