

WHY BUY A

Silky Saws cut as you pull the blade towards you.

Pulling puts the saw under tension, makes it stronger and naturally straightens the cut – pushing compresses the blade meaning you can bend and buckle it when cutting.

Mirai-Me smooth cutting teeth.

The teeth have 4 cutting angles that dramatically increase cutting speed and leaving an exceptionally smooth surface.

Taper Ground blades and Non-set teeth.

The blades are thicker at the tooth edge and thinner at the back of the blade, reducing resistance and giving a smoother, easier and faster cutting performance.

Hard Chrome Plated Carbon Steel Blades.

The blades are resistant to rust and the effects of resin.

Impulse Hardened Teeth.

The teeth stay sharp around 3 times longer than non-hardened teeth, while the remainder of the blade retains its normal flexibility.

Ergonomically Designed Handles.

Reduces vibration and offers superior grip.

Silky Saws cut exceedingly fast and efficiently!
