# Installation Instruction for LED Neon Channels

• Ensure proper surface cleaning before installation, as the neon channel's silicon material is susceptible to accumulating dust.
1

• Use a sharp knife to cut the neon channel to the desired size. Before cutting, securely hold the string, then proceed to cut the channel slowly.

2

• After cutting around half of the channel, check the string inside to ensure you do not cut the string.

3

• Tighten the string by either securing it with the power feed or taping it at the back of the LED strip.

4

• Pull the string gently, and from the other end, ensure the LED strip is not getting stuck anywhere and is moving into the channel smoothly.
