COMPLIANCE STATEMENT

The Study Director hereby declares that the work was performed under his supervision and in accordance with the mutually agreed study plan and the in house procedures. It is assured that the reported results represent the raw data obtained during the experimental work. No circumstances have been left unreported which may have affected the quality or integrity of the data or which might have a potential bearing on the validity and reproducibility of this study. The Study Director accepts overall responsibility for the technical conduct of the study as well as the interpretation, documentation and reporting of the results.

2. OBJECTIVE

The purpose of this study is to assess the anti-inflammatory activity of test substance in Mouse Macrophages (RAW 264.7) cell line by estimating the inflammatory cytokines (TNF- α , COX-2, NO and IL-6) against LPS induced cell damage.

6. METHOD

6.1 Outline of the method

The *in vitro* cytotoxicity was performed for the test substances on RAW 264.7 cell line to find toxic concentrations of the test substance and to evaluate the effect of test substance on the levels of LPS induced inflammatory cytokines (TNF- α and IL-6), COX-2 inhibitory activity and NO (nitric oxide) radical scavenging potency.

6.2 Preparation of test solution

10 mg of test substance was weighed and dissolved in DMEM-HG medium supplemented with 2% inactivated FBS to obtain a stock solution of 10mg/mL. Furthermore, serial-two fold dilutions were prepared from the stock solution to prepare lower concentrations for cytotoxicity testing.

6.3 Cell line and Culture medium

Mouse Macrophage cell line (Raw264.7) was procured from National Centre for Cell Sciences (NCCS), Pune, India. Stock cells were cultured in DMEM-HG supplemented with 10% inactivated Fetal Bovine Serum (FBS), penicillin (100 IU/ml), streptomycin (100 μ g/mL) and amphotericin B (5 μ g/ml) in an humidified atmosphere of 5% CO₂ at 37°C until confluent. The cells were dissociated with TPVG solution (0.2% Trypsin, 0.02% EDTA, 0.05% glucose in PBS). The stock cultures were grown in 25 cm² culture flasks and all experiments were carried out in 96 well microtitre plates (Tarsons India Pvt. Ltd., Kolkata, India).

6.4 Cytotoxicity Studies

The monolayer cell culture was trypsinized and the cell count was adjusted to 100,000 cells/ml using DMEM-HG containing 10% FBS. To each well of the 96 well microtitre plate, 0.1 mL of the diluted cell suspension was added. After 24 h, when a partial monolayer was formed, the supernatant was flicked off, the monolayer washed once with medium and different test concentrations were added on to the partial monolayer in the microtitre plates. The untreated cells

| | | |
|---------------------------|--------------------------------|---|
| STUDY REPORT | |  |
| DEPARTMENT : CELL BIOLOGY | STUDY NO: RR211182/CB/AI/12-21 | |

were maintained as cell control for comparison. The plates were then incubated at 37° C for 24 h in 5% CO₂ atmosphere, and microscopic examination was carried out and observations were noted after 24h, the test solutions in the wells were discarded and 50 µL of MTT is added with DPBS was added to each well. The plates were gently shaken and incubated for 3 h at 37° C in 5% CO₂ atmosphere. The supernatant was removed and 100 µL of DMSO was added and the plates were gently shaken to solubilize the formazan. The absorbance was measured using a microplate reader at a wave length of 570nm.

6.5 Anti-Inflammatory Activity

6.5.1 *In vitro* TNF- α , IL-6 and Nitric oxide inhibitory activity of test substance

Step I: Induction of TNF- α , IL-6 and Nitric oxide in RAW264.7 cells

Raw264.7 cells will be seeded in to 6 well culture dishes at a cell population 1.5 to 2x10⁵ cells/ml in DMEM with 10% FBS. After 24 h, the cells are treated with known non-toxic concentration of test substance along with 5µg/ml of lipopolysaccharide (LPS) and incubated at 37 °C with 5% CO₂ for 4 h. After incubation, the cell supernatant is collected, centrifuged, separated and stored at -20° C till use.

Step II: Estimation of TNF- α , IL-6 and Nitric oxide in cell supernatant by ELISA and colorimetric assay

All the reagents, standard solutions and samples will be thawed to room temperature before use. 100 µl of samples will be transferred to sample wells and the plates will be incubated for 1.5h at 37 °C as per the manufacturer's instruction. For TNF- α quantification, Mouse TNF- α (Tumour Necrosis Factor Alpha) ELISA kit by Elabscience was employed and for IL-6 estimation, Mouse IL-6 ELISA kit by Elabscience was employed. In case of nitric oxide

estimation, the cells were treated with LPS and test compounds for 24h, followed by collection of supernatant and was quantified using Nitric Oxide Colorimetric Assay Kit (Elabscience).

6.6 Estimation of the effect of test substance on COX-2 enzyme

6.6.1 COX-2 procedure

Cells were treated with different concentrations of the test substance and supernatants were evaluated for the inhibition on COX-2. Then, cells were collected and washed with DPBS for 1-2 times. Centrifuged at 1000g for 5 min and supernatant is preserved in -20°C for further detection. All the reagents, standard solutions and samples were thawed to room temperature before use. The assay was performed according to the manufacturer's instructions and the absorbance was measured using microplate reader at 450nm.

7. RESULTS

The test substances showed no cytotoxicity against RAW264.7 cell line. Test doses which exhibited 20% or less cytotoxicity were selected for the anti-inflammatory assay.

Table 1: Cytotoxic properties of test substance against RAW 264.7 cell line

| Sample code | Sample number | Concentration (µg/ml) | % of cytotoxicity | CTC50 (µg/ml) |
|---------------|---------------|-----------------------|-------------------|---------------|
| Ortho Support | RR211182 | 1000 | 28.76 ± 0.36 | >1000 |

8. DISCUSSION AND CONCLUSION

Based on the stock concentration provided, each of the test substances was evaluated for their cytotoxicity with eight different concentrations on RAW264.7 cells. Furthermore, the safest concentration of the test compound that exhibited less than or equal to 20% cytotoxicity was selected for performing the assay. Overall, the test compound assayed did not exhibit any significant anti-inflammatory property against the markers tested. However, in Nitric oxide estimation assay, test substance RR211181 at 500 µg/mL exhibited a mild protective activity. The test substance was also evaluated for its inhibitory property on COX-2 enzyme. However, the test substance did not exhibit COX-2 inhibition in mouse macrophage cells.

9. ARCHIVING

- Test Samples will be stored for 3 months after the final report submission
- Raw data, documents report will be archived for 3 years.

10. REPORT DISTRIBUTION

- Sponsor: One signed final report (Copy no. 1/2) in the original.
- Archives: One signed final report (Copy no. 2/2) in original along with raw data file.
