# Option 'W' instruction manual

LED & defogger control: From the off position wave past the motion sensors `·   ·` to turn on the LED lights and defogger at the same time. Wave again within 3 seconds to switch the colour temperature (cool white, natural white, warm white, turn off, cycle). If you turn the LED light on and wait longer than 3 seconds, it will keep that desired colour and the memory function will return it once cycled off and back on.

Wave over the sensor `·   ·` and hold to adjust the brightness when the LED light is on.

Notes: The defogger has a 1 hour auto cut off time and will turn off if left on (this will not turn off the LED lights).

The memory function will store the desired colour and brightness if turned off via the motion sensor or external power.
