

Test Mode Makes this Device Audible!

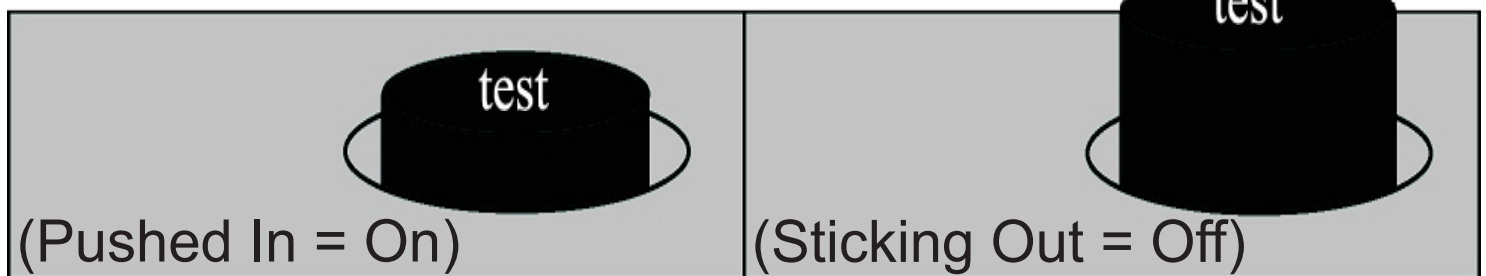

This is the unit's test button. The purpose of this button is to allow you to hear a representation of the device in repelling mode. When pressed, the device starts emitting a buzzing sound that you can hear. **However**, the unit **will no longer** repel when on this setting.

If the device is **activated & constantly buzzing**, this means the unit is in *test mode*. To return the unit into the *standard repelling mode*: simply press the test button and make sure it is sticking out. When the device is on and you can not hear the buzzing sound, the unit is in proper repelling mode.

TEST MODE - ON
(Not Repelling)

STANDARD REPELLING
TEST MODE - OFF
(Repelling)

Again, the unit will **not** repel rodents when it is in *test mode*.

This is because the test mode changes the frequencies, taking the unit **out of the rodent-repulsing frequencies** and into human hearing range.
