

Temple Grandin

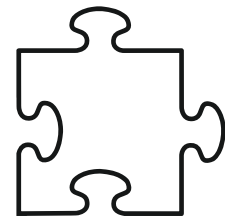

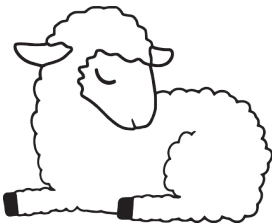

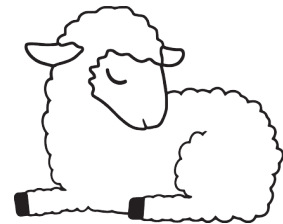

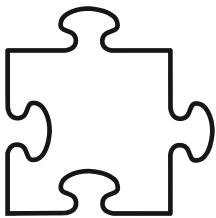

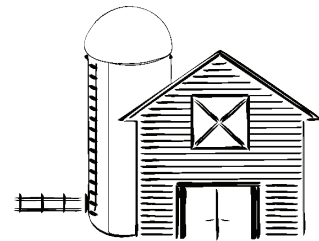

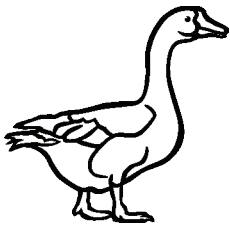

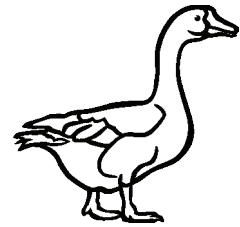

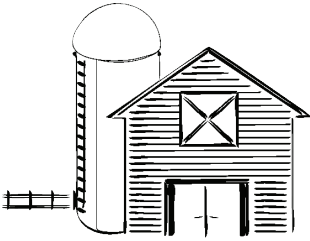

Temple Grandin was born in 1947 in the United States. She is a famous biologist and animal rights advocate. A biologist is a scientist that studies the natural world. She is most known for changing the way in which farms treat and handle animals that are raised for food. She is also famous for talking about autism and how people with autism should be treated. As a child, Grandin did not speak until she was four years old. She was able to learn to speak thanks to the hard work of her parents and speech therapists. As a result of this early treatment, she was able to go on to get a college degree in psychology and a doctorate degree in animal science. Some of her autism symptoms include difficulties with social interactions, speech delay, and sensory sensitivity.
