

Isaac Newton

Isaac Newton was born in England in 1643. He is considered to be one of the most important scientists in history. He was also a mathematician and an astronomer. An astronomer is somebody that studies things outside of the Earth such as the stars and planets. Newton is most famous for developing the theory of gravity and the laws of motion. He also created a new type of math called calculus and made telescopes a lot better. Albert Einstein later called Isaac Newton one of the smartest people that ever lived.
