Measuring Eardrum Temperature

Note: Make sure both user and thermometer have remained at a constant ambient temperature for at least 30 minutes.

Step 1: Press the Power/Measure button to turn the thermometer on.

Step 2: The Ear measurement mode is selected by default. Place a new probe cover securely on the thermometer ear probe.
Step 3: Insert thermometer probe into the ear canal. For accurate measurement, perform an ear tug so that the probe is aligned with the eardrum.

Step 4: Press the Power/Measure button once. Reading will be displayed in about 1 second.

Step 5: To take next measurement, wait until color coded ring stops glowing. Press the Power/Measure button once and screen will show “- - - -” and blinking unit (°F or °C). Repeat Step 3 above to continue with measurement.

Measuring Object Surface Temperature

Step 1: Press the Power/Measure button to turn the thermometer on.

Step 2: Press the Mode button (↑/↓) to switch to Object measurement mode (🏠).

Step 3: Point thermometer at the object (for example: milk bottle) within 2” or 5cm distance away from the surface.

Press the Power/Measure button once. Reading will be displayed in about 1 second.

Note: Probe cover is not required for measuring object surface temperature.

Note: To measure ambient temperature, press the Power/Measure button once without pointing at any object.
