While on Empower hCG for 6 months, my testicles ended up having a volume of 5 CC, measured using Doppler ultrasound, which is equivalent to the size of a I ended up going back to Pregnyl even though the cost was 50 percent After 4 weeks at 500 units twice weekly, my testicles have increased to a low normal

HCG (Human Chorionic Gonadotropin) Pregnyl

Şekil a.

It has an alpha subunit that is 92 amino acids long and identical to that of luteinizing hormone (LH), follicle-stimulating hormone (FSH) and thyroid-stimulating hormone (TSH) It has a beta subunit that is unique to HCG. How Supplied: Human Chorionic Gonadotropin is widely available in various human and veterinary drug

A randomized three-way cross-over study in healthy pituitary-suppressed women to compare the bioavailability of human chorionic gonadotrophin (Pregnyl®) after intramuscular and subcutaneous administration

B.M.J.L.Mannaerts^{1,4}, T.B.P.Geurts² and J.Odink³

The objective of this study was to compare the bioavailability of s.c. and i.m. administration of human chorionic gonadotrophin (HCG; Pregnyl®). In a randomized, single-centre, three-way cross-over study, 18 healthy pituitary-suppressed volunteers were assigned to single HCG injections of 5000 and 10 000 IU i.m. and 10 000 IU s.c. Rate (C_{max} , t_{max}) and extent (area under curve from zero to infinity ($AUC_{0-\infty}$)) of absorption of HCG were determined. Serum immunoreactive HCG increased from 0.4–0.5 IU/l at baseline to mean peak concentrations, which were reached 20 h after injection of 156 IU/l with 5000 IU i.m., of 307 IU/l with 10 000 IU i.m. and of 339 IU/l with 10 000 IU s.c. Eight days after administration, <10% of the maximum HCG activity was found for each regimen. The elimination half-life ($t_1/2$) was on average 32–33 h, irrespective of the treatment regimen. Intramuscular and s.c. injections of 10 000 IU HCG were bioequivalent with respect to $AUC_{0-\infty}$. The C_{max} and t_{max} were also similar between the two administration routes but bioequivalence could not be proven due to intersubject variability. Intramuscular doses of 5000 IU and 10 000 IU HCG were dose-proportional. Since s.c. HCG is bioequivalent to i.m. HCG with respect to extent of absorption (its major pharmacokinetic variable) and is well tolerated, the s.c. administration route may be effectively and safely used in assisted reproduction. Moreover, since s.c. injection can be performed by the patients themselves, acceptability may be enhanced.

Key words: bioequivalence/human chorionic gonadotrophin/intramuscular/pharmacokinetics/subcutaneous

both in anovulatory infertility and in-vitro fertilization (IVF) (5000–10 000 IU as a single dose). HCG is also used for luteal phase support, especially if gonadotrophin-releasing hormone (GnRH) agonists have been used for pituitary suppression (1000–3000 IU, 2–3 times during the first 9 days following ovulation). In men, HCG is used for the treatment of hypogonadal hypogonadism (1000–2000 IU, 2–3 times a week), cryptorchidism (250–1500 IU twice weekly for 6 weeks) and delayed puberty associated with insufficient gonadotrophic pituitary function (1500 IU, 2–3 times a week for at least 6 months).

Urinary gonadotrophins are usually given using the i.m. route of administration. As a rule, such injections are given by skilful spouses, qualified nurses, general practitioners or other physicians, often requiring frequent visits to the clinic. Compared to the i.m. route, the s.c. route has the main advantage that self-administration is feasible, thus limiting the number of visits to the clinic. Until recently, it was believed that urinary gonadotrophins could not be injected s.c., since the administration of these preparations with their relatively high amounts of impurities via this route may induce undesirable local adverse reactions (Le Cotonneq *et al.*, 1993). Although allergic reactions have been described after s.c. injection of urinary gonadotrophins in animals (Biffoni *et al.*, 1994), studies in humans suggest that the s.c. route is safe and that the incidence of local adverse reactions is low (Saal *et al.*, 1991a, b; Jones and Darme, 1993; Jones *et al.*, 1994; Out *et al.*, 1996a; Schmutzberger *et al.*, 1996). Thus, the bioequivalence issue of s.c. and i.m. administration of HCG (which has not previously been investigated in women) is important in clinical decision making when choosing an efficacious and safe administration route for these preparations. Moreover, as a result of an increasing shortage of HCG and the tendency to use lower HCG doses for assisted reproduction, it is useful to know how the pharmacokinetic behaviour of i.m. HCG administration of 5000 IU compares to 10 000 IU.

The objectives of this study were to assess the bioequivalence of an s.c. and i.m. administered HCG preparation as well as to assess dose-proportionality of two i.m. administered HCG doses.

Introduction

Human chorionic gonadotrophin (HCG) is produced by the trophoblast and is excreted in maternal urine during pregnancy. It is a peptide hormone that stimulates gonadal steroidogenesis by a mechanism similar to that of luteinizing hormone (LH) (Ren and Braunstein, 1992). Pregnyl® is an HCG preparation which is obtained from the urine of pregnant women and is used for ovulation induction after ovarian stimulation with follicle stimulating hormone (FSH)-containing preparations

Materials and methods

The study was designed as a single-centre, randomized, single-dose, three-way cross-over study in healthy female volunteers and was performed at the TNO Nutrition and Food Research Institute, Zeist (The Netherlands). The study was approved by the Medical Ethics Committee of the study centre and each subject had given her written informed consent before participating in the study. The study was

Pregnyl is used to treat men whose: sperm production does not work properly puberty is delayed the testicles (one or both) have not migrated into the What you need to know before using Pregnyl Do not use Pregnyl if you are allergic to human chorionic gonadotrophin or any of the other ingredients of this medicine (listed in section 6)

Pregnyl - RxList

Human chorionic gonadotropin (HCG) is a hormone that is used to cause ovulation and to treat infertility in This medicine is not effective in women with primary ovarian HCG is used in men to treat hypogonadism, a condition in which the body doesn't produce enough
