

Legend

 Lights with power injection cable running inside

 Lights with no other cables inside

 Extension cables

End of runs

Use Y-splitter and extension to run up to that top peak

This run ends here

Mount controller under the deck, follow the power injection guide and install one pwr injection cable into the controller and run the power injection inside the track and inject power as close to the end of that lower run as you can. You wont need power injection up top because you will be using the extra power supply to boost power with the soffit plug
