

## Prana Tech: Innovative Wearable Platform for Training any Breathing Exercise

Andre Persidsky, Alex Ahlund, Paul Abramson MD www.prana.co

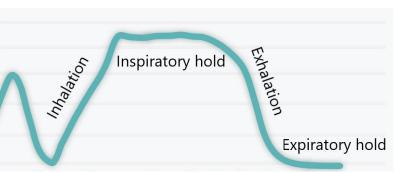

### Introduction

**Breathing exercises** and breath control techniques are increasingly being investigated as potential **interventions** for a wide range of health conditions including COPD, asthma, hypertension, insomnia, and various psychophysiological conditions including anxiety, depression, and PTSD. Numerous recent and ongoing clinical studies have evaluated the efficacy of these breathing techniques, with some promising results.

### Background

Breathing exercises can be complex. Studies conducted so far have employed a wide variety of **breathing exercise protocols**, testing multiple variables including different rates, depths, and patterns of breathing. Breath pattern parameters include varying inhalation and exhalation counts, inspiratory and expiratory holds, and the variation of these parameters over a sequence of breaths.

Two additional important variables frequently considered by researchers are whether **diaphragmatic breathing** and a particular **posture** are employed, as both can potentially impact pulmonary measures such as FEV1, FRC, and FVC<sup>1,2</sup>

### The Problem

Ensuring that patients comply and adhere to the chosen breathing protocols can be a challenge, especially when breathing exercises are performed outside the clinical setting, and for extended durations.

Furthermore, patients interested in adopting such breath control practices in their daily lives as a therapy face several challenges:

- Lack of feedback to confirm if they are performing the breathing exercises correctly and consistently
- Loss of interest due to boredom and lack of engagement
- Lack of shareable breathing session data for healthcare providers, and for charting progress
- Lack of controlling for diaphragmatic breathing and posture variation

### The Solution

Prana Tech presents a comprehensive wearable platform and app for training any at-rest breathing exercise using real-time sensor feedback. Prana offers over 80 exercises, with dozens derived from clinical study protocols. The device was recently launched and can be currently purchased at <a href="https://www.prana.co">www.prana.co</a>

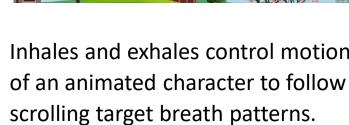

The patented wearable offers a new retractable form factor with numerous advantages over existing respiratory sensing devices:

- Can be quickly worn over or under any style of clothing
- No need for adhesive skin patches or clipping to tight waistbands or bras
- Can be worn at multiple positions on the trunk for tracking diaphragmatic or chest breathing, as well as lower or upper back posture
- Retractable belt more compact than chest strap devices, only 37g total weight
- Advanced sensors and signal processing for accurate respiratory/posture data

Prana's app offers two training modes: **Visual** (lightly gamified), and **haptic**, and offers detailed shareable session data, and an advanced passive tracking mode.

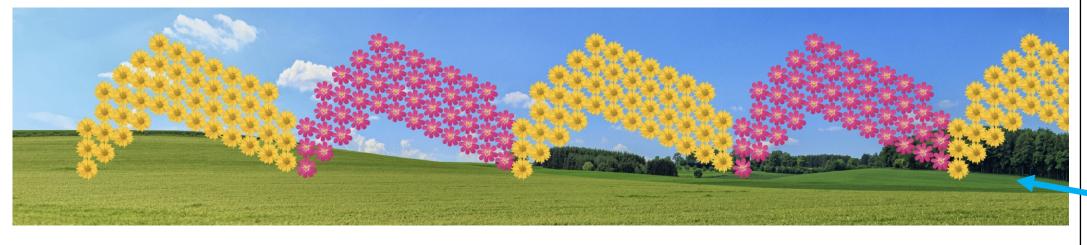

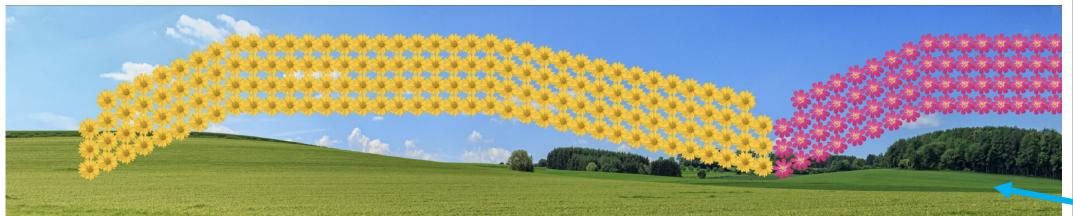

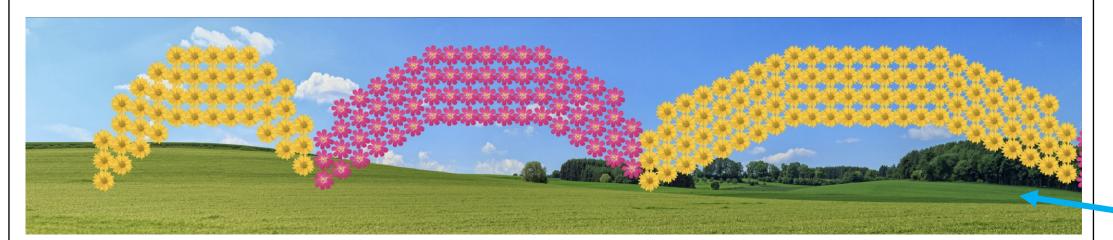

# Session Details May 4, 2023 at 11:08 PM Training: Breathing with Posture Buzzer Training Mins Adful Breaths: 92.1% (47 of 51) Beathing Exercise: RELAX - Slow Your Breath: Buzzer Back Regression Details May 4, 2023 at 11:08 PM Training: Breathing with Posture Buzzer Training Mins Mi

### Prana Tech's Breath Training Matches Study Protocols for Breathing Exercises

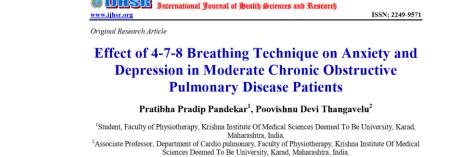

In addition to guiding complex and fully customizable breathing patterns, the Prana Wearable and app can optionally detect and enforce diaphragmatic breathing and upright posture during the breathing exercise training modes. For example, in the visual breath training above, slouching can cause the scrolling to momentarily pause.

# **Examples of Recent Studies Evaluating Breath Control Techniques**

Study breathing exercise: Inhale 2s, exhale 5s

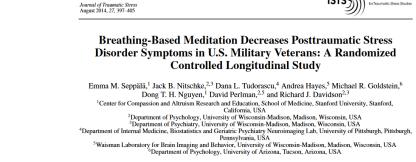

Study breathing exercise: Inhale 4s, hold 7s, exhale 8s

Study breathing exercise: Farinelli Sequence vs. DB

A Study breathing exercise: Controlled breath holds

Study breathing exercise: Sudarshan Kriya Yoga
