Technical Data Sheet V3.0

TPU 95A HF

• Basic Info

Bambu TPU 95A HF is an optimized TPU filament designed for high-speed 3D printing. Compared to regular TPU 95A, TPU 95A HF offers an impressive 3x faster printing speed, effectively addressing the common problem of lengthy prints associated with other TPU filaments. TPU 95A HF maintains exceptional interlayer adhesion, impact resistance, flexibility, and cold-temperature resilience, just like traditional TPU filaments. Experience faster TPU printing without any compromises.

<p><i>*All the specimens were annealed and dried at 70 °C for 12 h before testing. It's not recommended to anneal prints of TPU, or prints with not very simple shape and structure can deform obviously. When drying the filament and annealing the prints, it's required to use an oven that has big enough inside volume and can provides even temperature distribution, such as a blast drying oven (forced-air drying oven), and the filament and prints need to be away from the heater, and a micro-wave oven or kitchen oven is not compatible, otherwise the filament and prints can get damaged.</i></p>
