

Basin Care

Concrete

- As concrete is a highly alkaline material, avoid using acidic or strong cleaning detergents. We recommend a mild soap and water for regular cleaning. Ensure you wipe down and allow to dry to avoid a build-up of hard water deposits.
- Remove any stains immediately to prevent permanent damage.
- Avoid abrasive cleaning pads and scourers.
- Do not pour harsh chemicals down the sink as this can damage the waste system.

Porcelain

- To clean, wipe down your porcelain basin everyday with a gentle cloth and mild soap cleaner.
- White vinegar can be applied to stubborn marks or stains. Rinse thoroughly.
- A wet pumice stone can also be used to remove mineral build-up and rust without damaging the surface.
- Avoid dropping heavy items or abrasive chemicals into the sink to safeguard against damage.

Ceramic

- Regularly clean with a soft micro fibre cloth and warm water. Avoid harsh detergents or scouring pads. Use a low PH cleaner if needed.

- Avoid dropping heavy items or abrasive chemicals into the sink to safeguard against damage.
