

how to use two amps hum-free & safely

When using two amps (unlike for dual channel DI-recording into amp-sims) you need to prevent the typical ground loop that is created by dual-amp set ups. Please use an isolating transformer (on one channel) to interrupt the loop and prevent the expected AC-hum.

Recommended products are from Lehle the P-Iso or P-Split, the Palmer PLI-01, the Ebtech Hum Eliminator, the HUM-X or similar products / isolating transformers.

Please NEVER lift the ground of one amp at its power source to eliminate the hum. That's highly hazardous. If the amp had a failure you could electrocute yourself.

By using an isolator you interrupt the ground loop and enjoy hum free dual amping safely.
