

# VaporCup™

## - Deluxe -

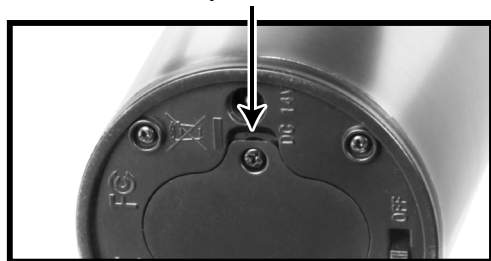

### IMPORTANT

Please read these tips before you use your new VaporCup for the first time.

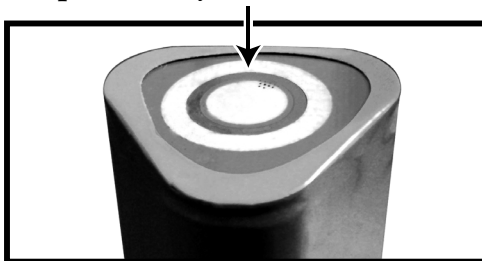

Before you use your VaporCup, there are a few things you should do to ensure the best results:

- 1) Before you do anything else, insert the lithium ion battery into the VaporCup. (Unless already pre-installed)
  - A) If you do not see a battery in the box with your VaporCup, then it was pre-installed for your convenience. If that is the case, then skip this section and go straight to section 2 below. If not, then continue with B.
  - B) Unscrew the battery door on the bottom of the VaporCup. There is only one screw.
  - C) Remove the battery door and insert the battery with the top of the battery inserted first. The top of the battery is the side with the gold circle with a gold ring around it. The bottom of the battery is blank.
  - D) Replace the battery door and screw it shut. **NOTE: Never use a drill to tighten VaporCup screws.** Use only a regular philips head screwdriver that fits well. Turn right (Clockwise) to tighten. Turn left (counter-clockwise) to loosen. Tighten screw until snug, but **do not overtighten.**

Battery door screw

Top of Battery: Insert this end first

- 2) We recommend charging the VaporCup for 4 hours before using it in battery mode (unplugged).  
*NOTE: You can use the VaporCup while it is plugged in for charging.*  
The steps below optimize the battery's life span & effectiveness, and allow an optimal charge going forward.
  - A) On the bottom of the VaporCup, switch on the master power button (on/off).
  - B) Plug the power cord into the port on the bottom of the VaporCup (See picture above)
  - C) Plug the power cord into an electrical socket and leave the VaporCup to charge for 4 hours. You can use the VaporCup while it is plugged in, but do not unplug it for the initial 4 hours.
  - D) After charging for 4 hours, it is best to turn on the VaporCup & let the battery drain completely once. This sets up the battery for optimal performance. Then you can charge it up and you are ready to go.
- 3) Once your VaporCup is fully charged, turn it on. Then let it heat up and run for one 18 minute cycle. This burns off any residual manufacturing residues or smells, if there are any.
  - A) On the bottom of the VaporCup, switch on the master power button (on/off).
  - B) Push the large power button on the front display panel, and allow to heat up to the default temperature.
  - C) Remove the Storage Lid and Screw Cap, allowing the heat chamber to vent any residual fumes.
  - D) Let your VaporCup sit open for one 18 minute cycle to allow all residues or smells to burn off. Repeat as necessary. **NOTE: VaporCup automatically turns off after 18 minutes as a safety feature.**

**Your VaporCup is now ready for use. We hope you enjoy it!**
