

Stick N Stay®

DRIFT CONTROL // DEPOSITION AID // EVAPORATION PROTECTION // WASH OFF RESISTANCE

Stick N Stay® utility modifier is an all-in-one tank mix partner formulated to maximize chemical sprays by controlling the water in the tank.

Instead of spreading tank mix droplets like surfactants, which causes actives to drip right off the target and onto the ground, Stick N Stay works differently by creating spray droplets with a high contact angle and high surface tension. The result is a higher volume spray droplet that produces less drift, which allows for more spray to the plant, and more spray on the plant.

Our science-based approach is simple: get more active to the target, and keep it there longer.

HOW IT WORKS:

- Meticulous droplet control starting at the nozzle minimizes both large droplets and fines, resulting in 3X more spray volume to the target. Spray coverage is increased, and the spray pattern is uniform.
- Adhesive properties keep spray droplets on the target, preventing run off.
- Humectants keep spray droplets in a liquid state 2X longer than competitors, giving actives double the time to perform their functions.
- Spray droplets are protected 4X longer from rain and overhead irrigation.

BENEFITS:

- Low use rates — 0.125 - 0.5% (125 - 500ml/100L)
- Formulated with food-grade ingredients using hydrocolloid technology. No cautionary warnings on the label for applicators or the environment.
- Low phytotoxicity potential with most actives.
- Compatible with a myriad of chemistries across the spectrum of herbicides, insecticides, fungicides and nutrients.

3X more spray to the leaf
2X absorption potential
4X wash off resistance

Catapult your spray program to *levels never seen before.*
